

# VMware App Volumes 2.13.2 Release Notes

VMware App Volumes 2.13.2 | 23 JAN 2018

Check for additions and updates to these release notes.

## What's in the Release Notes

- [Resolved Issues](#)
- [Internationalization](#)

The release notes for VMware App Volumes 2.13.2 includes important updates and bug fixes.

## Resolved Issues

- A recalculation operation performed in a Microsoft Excel application (that was installed in base) takes twice the time when an Appstack is attached.
- On upgrading from App Volumes 2.12.1 to 2.13.1, machines created with the same name as machines that were marked as offline in the database prior to upgrade, throw a "virtualization disabled" error at login.
- The PATH environment variable does not retain all the path strings captured during provisioning.
- Writable volume space is getting filled up automatically even when users do install any applications or modify the user profile, leading to low writable disk space.
- Occurrence of blank screen upon disconnect and reconnect of View sessions.
- When there are agent machines online for more than 1 year, the message "Server error" is displayed on opening the **Online Entities** tab in App Volumes Manager and no **Online Entities** data is seen.

## Internationalization

App Volumes documentation is available in English.
