Windows Phone Device Management

1

Workspace ONE UEM powered by AirWatch provides you with a robust set of mobility management solutions for enrolling, securing, configuring, and managing your Windows Phone device deployment.

Through the Workspace ONE UEM console, you have several tools and features for managing the entire lifecycle of corporate and employee-owned devices. You can also enable end users to perform tasks themselves, for example, through the Self-Service Portal and user self-enrollment, which saves you vital time and resources.

Workspace ONE UEM allows you to enroll both corporate and employee-owned devices to configure and secure your enterprise data and content. By using device profiles, you can properly configure and secure your Windows Phone devices.

Use Workspace ONE UEM to manage Windows Phone devices from a central location. As an approved application in the Device Management (DM) system, the Workspace ONE Intelligent Hub can perform many device management functions that might not otherwise be available.

This chapter includes the following topics:

- [Windows Phone Features Matrix](#)
- [Windows Phone Requirements](#)

Windows Phone Features Matrix

AirWatch features and functionality differ by each supported Windows Phone Platform.

Feature	Windows 10 Mobile
Native Client Enrollment	✓
Hub Based Enrollment	✓
Native Enrollment with Web Dialog	✓
Force EULA/Terms of Use Acceptance	✓
Support for Option Prompts during Enrollment	✓
Active Directory/ LDAP	✓
Cloud Domain Join	✓
SMS	✓
Email Messages	✓
Push Notifications	✓

Feature	Windows 10 Mobile
Real Time Profile and Command Delivery	✓
Password Policy	✓
Lock, Ring, and Change Passcode Commands	✓
Enterprise Wipe	✓
Full Device Wipe	✓
Email & Exchange ActiveSync	✓
Wi-Fi	✓
VPN	✓
Root and CA Certificate Management	✓
Client Certificate Management (PFX)	✓
Client Certificate Management (SCEP)	✓
Device Restrictions and Settings	✓
Windows Hello	✓
Silent App Installation	✓
Silent App Update	✓
Silent App Removal	✓
App Whitelisting and Blacklisting	✓
Assigned Access (Kiosk Mode)	✓
VMware Browser	✓
VMware Content Locker	✓
Asset Tracking	✓
Device Status	✓
IP Address	✓
Location	✓
Network	✓
Send Support Message (Email and SMS only)	✓
Change Device Passcode	✓

Windows Phone Requirements

Before reading this guide, gather and prepare the requirements needed to use AirWatch with Windows Phone devices.

Requirements for Internal Application Management

- **Microsoft Developer's Account** – The AirWatch Admin must purchase an account, which consists of the following:
 - **Windows Account ID** – This account (different from the Windows Live ID) costs a fee and enables your company to add applications to the Windows Phone Development Center.
 - **Signing Certificate** – You must use a certificate for code signing trusted by the devices you are install the app on. You can confirm this by ensuring that the root issuer of the cert is included in the device Trusted Root Store. Consider a publicly-trusted certificate.
 - **Trusted Code Signing Certificate** – Windows 10 supports signing internal apps with a Trusted Code Signing certificate. AirWatch also supports pushing root and intermediate certificates to establish the certificate trust chain.

Important If you are considering the deployment of enterprise internal applications, make sure you generate and upload the AET before enrolling MDM devices. Otherwise, all devices enrolled before following the **Mobile Application Management Guide** will need to be re-enrolled again in order to access enterprise internal applications.

Enrollment Requirements

- **Active Environment** – This is your active Workspace ONE UEM environment and access to the Workspace ONE UEM console.
- **Appropriate Admin Permissions** – This type of permission allows you to create profiles, policies and manage devices within the UEM console.
- **Enrollment URL** – This URL is unique to your organization's enrollment environment and takes you directly to the enrollment screen. For example, **mdm.acme.com**.
- **Group ID** – This associates your device with your corporate role and is defined in the UEM console.

Important If your enrollment server is behind a proxy, the Windows services need to be configured to be proxy-aware when configuring your network settings.

Windows Phone Enrollment Overview

2

Device enrollment establishes the initial communication with AirWatch to enable Mobile Device Management (MDM). Windows Phone devices enroll using MDM-functionality built into the Windows OS.

Enrollment Basics

The enrollment methods for Windows Phone devices vary based on your AirWatch deployment, enterprise integrations, and device operating system. For more information, see [Windows Phone Features Matrix](#).

Before enrolling devices, ensure that you have the required enrollment information. See [Windows Phone Requirements](#) for more information.

Simplify end-user enrollment by setting up the Windows Auto-Discovery Services (WADS) in your AirWatch environment. WADS supports an on-premises solution and cloud-based WADS.

The enrollment methods use either the native MDM functionality of the Windows operating system, the Workspace ONE Intelligent Hub for Windows, or Azure AD integration.

Workspace ONE Intelligent Hub for Windows Enrollment

The simplest enrollment workflow uses the Workspace ONE Intelligent Hub for Windows to enroll devices. End users simply download the Workspace ONE Intelligent Hub from the Microsoft Store and follow the prompts to enroll. For more information on Hub-based enrollment, see [Workspace ONE Intelligent Hub Enrollment for Windows Phone](#).

Native MDM Enrollment

AirWatch supports enrolling Windows Phone devices using the native MDM enrollment workflow. The name of the native MDM solution varies based on the version of Windows. This enrollment flow changes based on the version of Windows and if you use WADS.

For more information, see [Native MDM Client Enrollment for Windows Phone](#)

Azure AD Integration Enrollment

Through integration with Microsoft Azure Active Directory, Windows devices can automatically enroll into AirWatch with minimal end-user interaction. Azure AD integration enrollment simplifies enrollment for both end users and admins. Azure AD integration enrollment supports two different enrollment flows: Join Azure AD and Office 365 enrollment, and adding a work account. All methods require configuring Azure AD integration with AirWatch.

Before you can enroll your devices using Azure AD integration, you must configure AirWatch and Azure AD. For more information, see [Configure Azure AD Identity Services Integration](#).

To enroll through Azure AD integration workflows, see [Enrollment through Azure AD Integration](#).

This chapter includes the following topics:

- [Workspace ONE Intelligent Hub Enrollment for Windows Phone](#)
- [Native MDM Client Enrollment for Windows Phone](#)
- [Enrollment through Azure AD Integration](#)

Workspace ONE Intelligent Hub Enrollment for Windows Phone

Use the Workspace ONE Intelligent Hub app to provide a single resource to enroll Windows Phone devices and facilitate communication between the device and the AirWatch Console.

Enrollment through the Workspace ONE Intelligent Hub provides simple step-by-step instructions for your end users. The app is downloaded through the Microsoft Store so end users can start enrollment whenever they are ready.

The Workspace ONE Intelligent Hub provides extra functionality to your Windows Mobile devices including location services.

Note Windows 10 Mobile devices use the VMware Workspace ONE Intelligent Hub. Windows Phone 8.0 and 8.1 devices use the AirWatch MDM Agent.

Enroll Windows 10 Mobile devices with the VMware Workspace ONE Intelligent Hub

Use the VMware Workspace ONE Intelligent Hub to enroll your Windows Mobile 10 devices. The VMware Workspace ONE Intelligent Hub provides a simplified enrollment flow for end users allowing for quick and easy enrollment.

Procedure

- 1 On the Windows 10 Mobile device, navigate to the Microsoft Store and search for VMware Workspace ONE Intelligent Hub and download it.
- 2 Install the application. Once installation finishes, start the app.

- 3 Select **Connect a work or school account** to the native Work Access enrollment client.
- 4 Select **Enroll in to device management**.
- 5 Enter the email address and select **Next**. If you are not using Windows Auto-Discovery, complete the following steps:
 - a Enter the **Server URL** and select **Next**.
 - b Enter the **Group ID** and select **Next**.
 - c Enter the **Username** and **Password**.
- 6 **Accept** the terms of use.
- 7 Select **Done**.
- 8 Open the VMware Workspace ONE Intelligent Hub to complete the enrollment. A second certificate pushes to the device to complete the enrollment. If the certificate has not installed after one minute, a link appears offering troubleshooting solutions.

Native MDM Client Enrollment for Windows Phone

The native MDM Client for Windows Phone devices allows end users to enroll devices without downloading the Workspace ONE Intelligent Hub. End users enter their enrollment information into the MDM Client and the device enrolls into AirWatch.

The name of the native MDM client depends on the version of Windows Phone. The client is called Work Access for Windows 10 Mobile devices.

Note Consider using the Workspace ONE Intelligent Hub enrollment method as it offers simple step-by-step instructions for the end user.

Enroll Windows Phone Devices with Work Access

Work Access is the native MDM enrollment method for Windows 10 devices. Enrolling through Work Access and using Windows Auto Discovery provides a quick and easy enrollment flow for end users.

Procedure

- 1 On the Windows 10 Mobile device, navigate to **Settings > Accounts > Work Access**.
- 2 Select **Enroll in to device management**.
- 3 Enter the end user **Email Address** and select **Connect**. If you do not have Windows Auto-Discovery enabled, completed the following steps:
 - a Enter the **Server**, using the following format: <Device Services hostname> such as ds01.awmdm.com.
 - b Select **Connect**
 - c Enter the **Group ID**
- 4 Enter the end-user **Username** and **Password**, and then select **Next**.

- 5 Accept the **Terms of Use** if enabled.

What to do next

You can also download the VMware Workspace ONE Intelligent Hub from the Microsoft Store following enrollment to add extra functionality to your Windows 10 Mobile device.

Enrollment through Azure AD Integration

Through integration with Microsoft Azure Active Directory, Windows devices can automatically enroll into AirWatch with minimal end-user interaction. Azure AD integration enrollment simplifies enrollment for both end users and admins.

Before you can enroll your devices using Azure AD Integration, you must configure AirWatch and Azure AD. The configuration requires entering information into your Azure AD and AirWatch deployments to facilitate communication.

Azure AD integration enrollment supports two different enrollment flows: Join Azure AD and Office365 enrollment. Both methods require configuring Azure AD integration with AirWatch.

For more information on configuring Active Directory in general, see the **Directory Services Guide**.

Important Enrollment through Azure AD integration requires Windows Mobile 10 and Azure Active Directory Premium License.

Configure Azure AD Identity Services Integration

Before you can use Azure AD to enroll your Windows devices, you must configure Workspace ONE UEM to use Azure AD as an Identity Service. Enabling Azure AD is a two-step process which requires the MDM-enrollment details to be added to Azure.

Prerequisites

You must have a Premium Azure AD P1 or P2 subscription to integrate Azure AD with Workspace ONE UEM. Azure AD integration with Workspace ONE UEM must be configured at the tenant where Active Directory (such as LDAP) is configured.

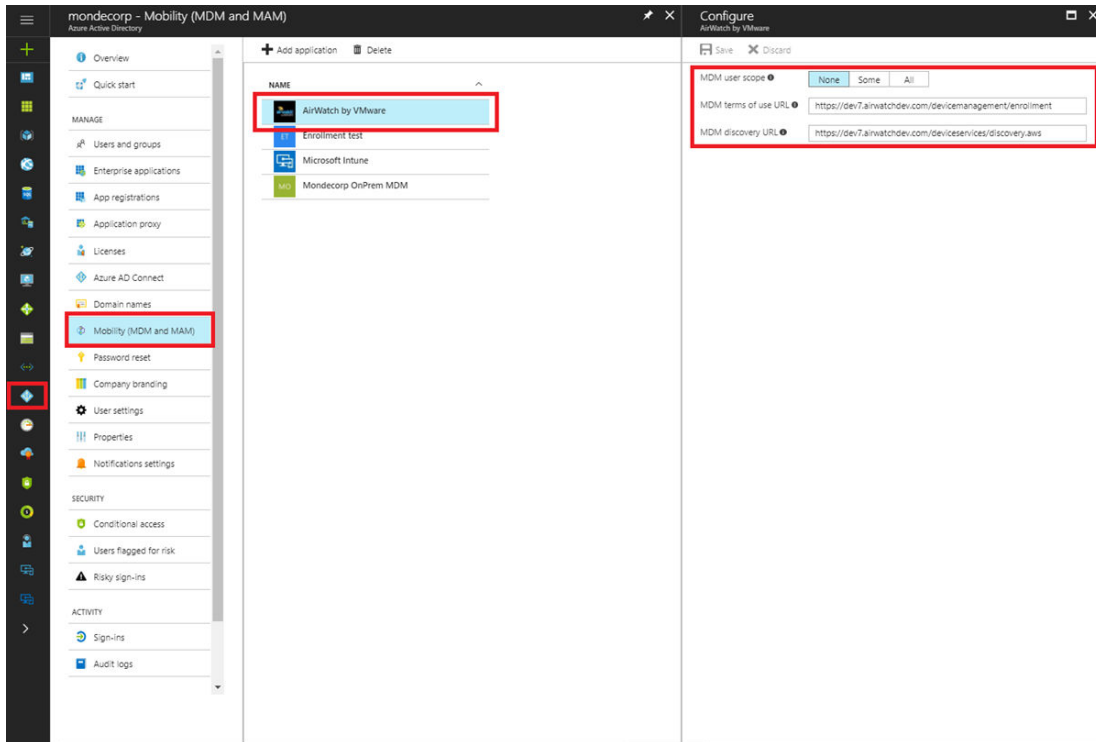

Important If you are setting the **Current Setting** to **Override** on the Directory Services system settings page, the LDAP settings must be configured and saved before enabling Azure AD for Identity Services.

Procedure

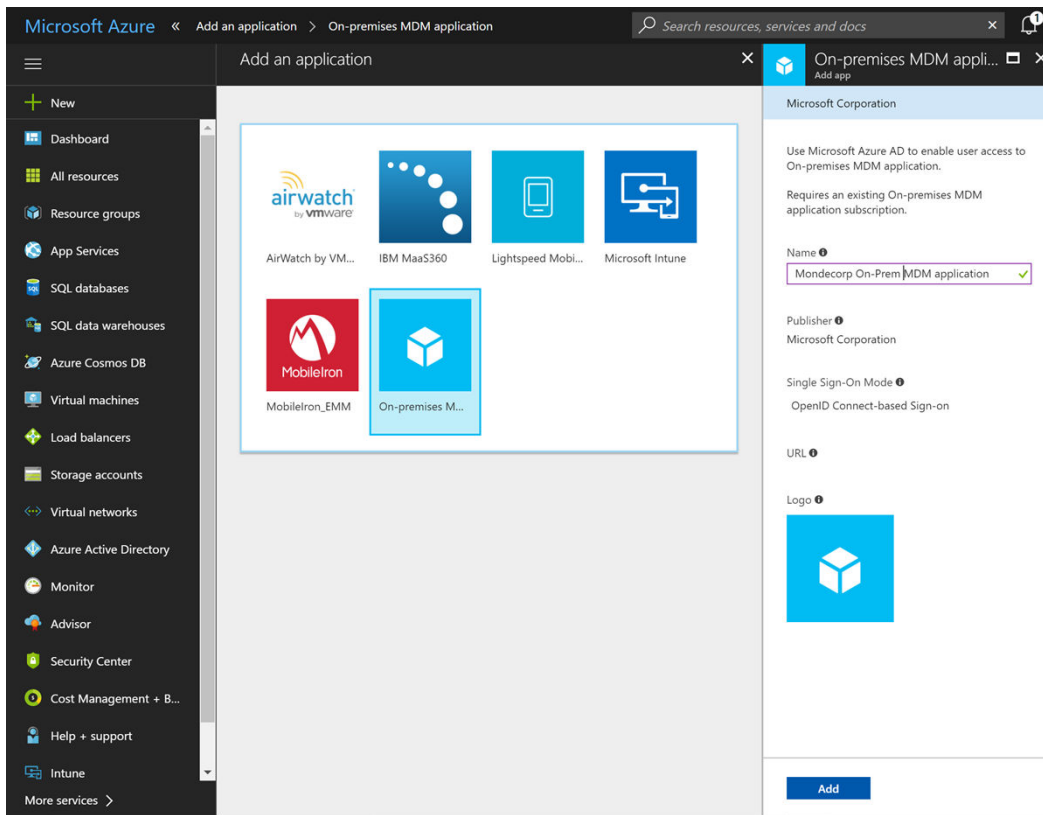

- 1 Navigate to **Groups & Settings > All Settings > System > Enterprise Integration > Directory Services**.
- 2 Enable **Use Azure AD for Identity Services** under **Advanced** settings. Once enabled, take note of the MDM Enrollment and MDM Terms of Use URLs as they are needed when configuring the Azure directory.
- 3 Log in to the Azure Management Portal with your Microsoft account or organizational account.

- 4 Select your directory and navigate to the **Mobility (MDM and MAM)** tab. This tab was formerly the Applications tab.
- 5 Select **Add Application** and select the AirWatch by VMware application.

You can use the default URLs if the user scope is set to none. If needed, you can also use placeholder URLs.

- 6 Leave the AirWatch by VMware application on the default settings. Change the **MDM user scope** to **None**.

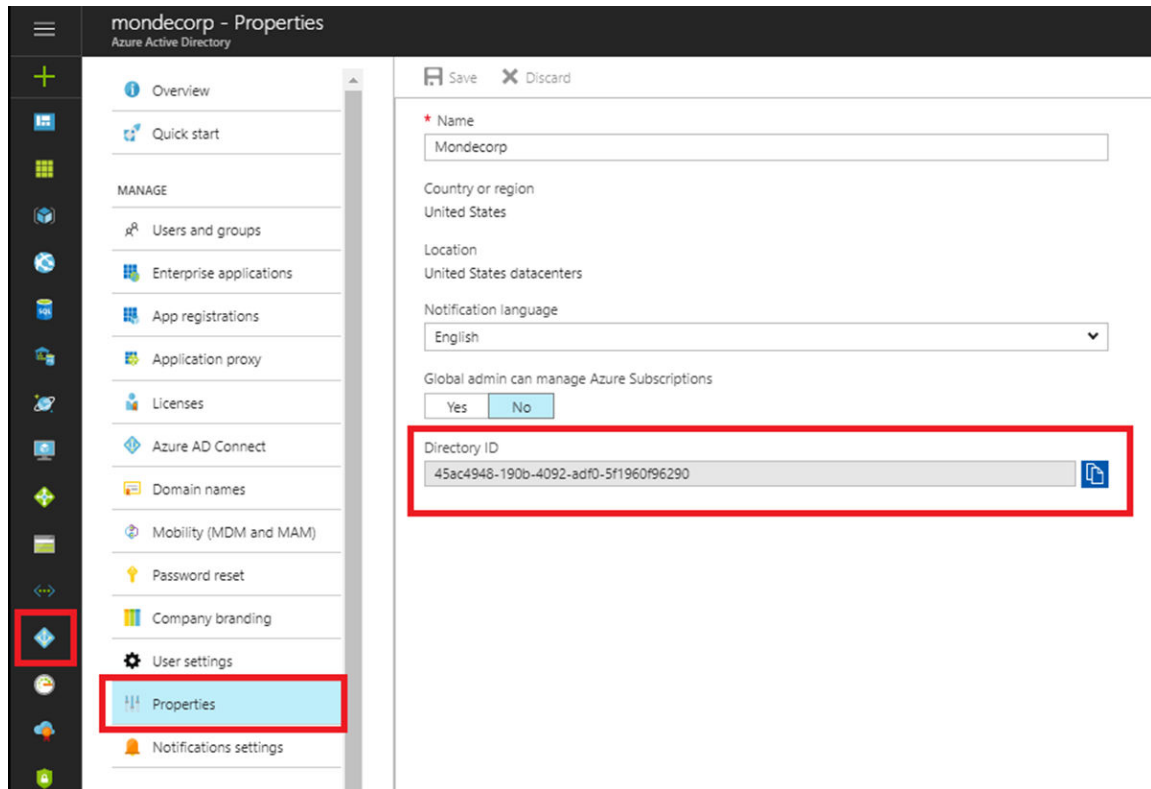

- 7 Select **Add Application** again and select the **On Premises MDM** application. You can rename the application when you add it.
- 8 Configure the On-Premises MDM application by entering the **MDM Enrollment URL** and **MDM Terms of Use** URLs from the Workspace ONE UEM Console.
- 9 Select **On-premises MDM application settings** then select **Required Permissions > Windows Azure Active Directory**.
- 10 Change the Application Permissions as follows:
 - a Select **Read and write directory data**.
 - b Select **Read and write devices**.
- 11 Change the Delegated Permissions as follows:
 - a Select **Access the directory as the signed-in user**.
 - b Select **Read directory data**.
 - c Select **Sign in and read user profile**.
- 12 Select the Properties settings and enter your device services host in the **APP ID URI** text box.
Use the same host that you used in the **MDM Enrollment URL** and **MDM Terms of Use** text boxes.
`https:// <MDM DS SERVER>`

- 13 Set **MDM user scope** to **All** to apply these settings to all users.

You can also limit the OOBEnrollment to selected Azure AD groups by selecting **Some** and adding the preferred groups.

- 14 Select **Save** to continue.

- 15 Navigate to the Properties tab and find the Azure Directory ID. This setting was formerly called the **Tenant ID**.

- 16 Select **User Account Details** in the top right corner. The Azure **Tenant Name** is the name of your Azure Directory. You can find the name under the **Domain** tab.

- 17 Return to the UEM Console and select **Use Azure AD for Identity Services** to configure Azure AD Integration.

- 18 Enter the **Azure Directory ID** as the **Tenant Identifier**. Enter the default domain as your Azure Directory **Tenant Name**.

- 19 Select **Save** to finish the process.

Enroll a Windows Phone Device with Cloud Domain Join

Cloud domain join enrollment uses Azure AD integration to enroll a device into the correct organization group in AirWatch automatically. Devices enrolled through the cloud domain join method are joined completely. This method means all users on the device join the domain.

Procedure

- 1 Navigate on the Windows 10 Mobile device to **Settings > Accounts > Your Account > Add a work or school account**.
- 2 Enter your **Email Address** and **Password**.
- 3 Select **Sign In**.
- 4 Ensure that the AirWatch welcome page displays and then select **Continue**..
- 5 Select **Next**.
- 6 Select **Accept** if terms of use are enabled.
- 7 Select **Join** to confirm that you want to enroll in AirWatch.
- 8 Select **Finish** to complete joining your device to AirWatch. Your device now downloads the applicable policies and profiles.

Enroll Windows Phone Devices through Office 365 Apps

If your company uses Office 365 and Azure AD integration, end users can enroll their own devices the first time they open an Office 365 app.

Procedure

- 1 Select **Add a Work Account** the first time you open an Office365 application.
- 2 Enter your **Email Address** and **Password**.
- 3 Select **Sign In**.
- 4 Ensure that the AirWatch welcome page displays.
- 5 Select **Continue**.
- 6 Select **Next**.
- 7 Select **Accept** if terms of use are enabled
- 8 Select **Join** to confirm that you want to enroll in AirWatch.
- 9 Select **Finish** to complete joining your device to AirWatch. Your device now downloads the applicable policies and profiles.

Windows Phone Profiles Overview

3

Profiles are the primary means by which you can manage devices. Configure profiles so your Windows Phone devices remain secure and can access your data.

Overview

You can think of profiles as the settings and rules that, when combined with compliance policies, help you enforce corporate rules and procedures. They contain the settings, configurations, and restrictions that you want to enforce on devices.

The individual settings you configure, such as the settings for Wi-Fi, VPN, and passcodes, are called payloads. Consider associating only one payload per profile. Create multiple profiles for the different settings you want to establish.

Device Access

Some device profiles configure the settings for accessing a Windows Phone device. Use these profiles to ensure that access to a device is limited only to authorized users.

Some examples of device access profiles include:

- Secure a device with a Passcode profile. For more information, see [Configure a Passcode Profile \(Windows Phone\)](#)
- Configure the native Passport functionality. For more information, see [Configure a Windows Hello Profile \(Windows Phone\)](#)
- Configure how the device home screen looks and control access to apps and settings. For more information, see [Configure an Assigned Access Profile \(Windows Phone\)](#).

Device Security

Ensure that your Windows Phone devices remain secure through device profiles. These profiles configure the native Windows security features or configure corporate security settings on a device through AirWatch.

Some examples of device security profiles include:

- Use a Wi-Fi profile to connect enrolled devices to your corporate Wi-Fi without sending the network credentials to users. For more information, see [Configure Wi-Fi Payloads \(Windows Phone\)](#).

- Keep corporate data secure with the Data Protection profile. For more information, see [Data Protection Profile \(Windows Phone\)](#).
- Ensure access to internal resources for your devices with the VPN profile. For more information, see [VPN Profile \(Windows Phone\)](#).

Device Configuration

Configure the various settings of your Windows Phone devices with the configuration profiles. These profiles configure the device settings to meet your business needs.

Some examples of device configuration profiles include:

- Set up an Exchange account on a device with an Exchange ActiveSync profile. For more information, see [Exchange ActiveSync Profiles \(Windows Phone\)](#).
- Restrict what applications can install on a device with the Application Control profile. For more information, see [Configure Application Control \(Windows Phone\)](#).

This chapter includes the following topics:

- [Configure a Passcode Profile \(Windows Phone\)](#)
- [Configure a Restrictions Payload \(Windows Phone\)](#)
- [Configure Wi-Fi Payloads \(Windows Phone\)](#)
- [VPN Profile \(Windows Phone\)](#)
- [Configure an Email Profile \(Windows Phone\)](#)
- [Exchange ActiveSync Profiles \(Windows Phone\)](#)
- [Configure Application Control \(Windows Phone\)](#)
- [Assigned Access Profile \(Windows Phone\)](#)
- [Credentials Profile \(Windows Phone\)](#)
- [SCEP Profile \(Windows Phone\)](#)
- [Windows Hello Profile \(Windows Phone\)](#)
- [Create a Windows Licensing Profile \(Windows Phone\)](#)
- [Data Protection Profile \(Windows Phone\)](#)
- [Create Custom Settings Profile \(Windows Phone\)](#)

Configure a Passcode Profile (Windows Phone)

Enforce a Passcode profile to protect end user devices with passcodes each time they return from an idle state. A passcode ensures that all sensitive corporate information on managed devices remains protected.

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.
- 2 Select **Windows** and then select **Windows Phone**.
- 3 Configure the profile's **General** settings.
- 4 Select the **Passcode** profile.
- 5 Configure the Passcode settings, including:

Settings	Descriptions
Password Complexity	Set whether required passcode is Simple or Complex .
Alphanumeric Password	Set whether the passcode must be alphanumeric or let the end user decide.
Require Idle State PIN or Password	Set whether the passcode or PIN must be entered when resuming the device from an idle state.
Minimum number of complex characters	Enter the minimum number of complex characters (lowercase, uppercase, symbols, numbers, etc.) required for a passcode.
Minimum Password Length	Enter the minimum number of characters a passcode must have.
Maximum Passcode Age (days)	Enforce users to renew passcodes at selected intervals.
Passcode History	Enter the number of passwords remembered. The end user cannot reuse a previous password. For example, if you entered 12 in this field, an end user cannot re-use the past twelve passwords.
Maximum Number of Failed Attempts	Reset the device to factory defaults if too many unsuccessful attempts have been made.
Max Inactivity Time Device Lock	Secure idle devices with short lock times. The time set here is the maximum amount of a time before the device requires a passcode to be entered. The end users may shorten that time in the device settings but cannot lengthen the time past the amount entered in this payload.

- 6 Select **Save & Publish** when you are finished to push the profile to devices.

Configure a Restrictions Payload (Windows Phone)

Deploy a restrictions payload for added security on Windows Phone devices. Restrictions payloads for Windows Phone devices can disable end user access to device features to ensure devices are not tampered with.

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.
- 2 Select **Windows** and then select **Windows Phone**.
- 3 Configure the profile's **General** settings.

- 4 Select the **Restrictions** profile.
- 5 Configure the **Administration** settings:

Settings	Descriptions
Allow Manual MDM Enrollment	Allow the end user to enroll into AirWatch through the native MDM enrollment. This restriction applies to all Windows Phone devices.
Allow User To Reset Phone	Allow the end user to factory reset their device. This restriction applies to all Windows Phone devices.
Allow Adding Non-Microsoft Accounts Manually	Allow the end user to add accounts such as Facebook or Twitter manually.
Experimentation	Allow Microsoft to experiment with the product to study user preferences or device behavior. This restriction applies to Windows 10 Mobile devices only.
Location	Allow the use of location services. This restriction applies to all Windows Phone devices.
Allow Manual Root Certificate Installation	Allow end user to manually install root and intermediate CAP certificates. This restriction applies to all Windows Phone devices.
User Decryption	Allow users to decrypt the device. This restriction applies to Windows 10 Mobile devices only.
Allow Telemetry	Allow the device to send telemetry information (such as SQM or Watson) to the AirWatch Console.
Allow User to Change Data Sense Settings	Allows the user to change the Data Sense application settings.
Date/Time	Allows the user to change the Date and Time settings.
VPN	Allows the user to change the VPN configuration.
Allow User to Change Account Settings	Allows the user to change the Account settings.
Allow Action Center Notifications	Allow app and device notifications to display in the Action Center of the device.
App Store	Allow access to the app store.
App Store Auto Update	Allows applications from the app store to automatically update.
Bluetooth	Allow the connection of devices through Bluetooth.
Allow Browser	Allow end users to use the native Internet Explorer browser.
Camera	Allows the user to access the camera function of the device.
Allow Copy and Paste	Allows the user to copy and paste on the device.
Cortana	Allow access to the Cortana application.
Direct Memory Access	Allows direct memory access.
Indexing of Encrypted Stores or Items	Allows the indexing of encrypted stores or items for faster searching.
Allow NFC	Allow the use of the Near Field Communication chip on the device.
Allow Save as of Office Files	Allows the user to Save as Office files and change the file name and location.
Allow Sharing Office Files	Allows the users to share Office files.

Settings	Descriptions
Allow Search to Use Location	Allows the user searches to use the device location services.
Screen Capture	Allows the user to take screenshots of the device.
Allow Storage Card	Allow the use of a SD card.
Allow Storing of Vision Search Images	Allow the storage of Vision Search images onto the device.
Allow Sync Settings Between Devices	Allows the users to sync their settings preferences between Windows 10 Mobile and Windows Desktop devices.
Allow Task Switching	Allows the users to use the task switcher to switch between apps.
Allow USB Connection	Allow desktop to access phone storage through USB. Both MTP and IPoUSB are disabled when this restriction is enforced.
Use Diacritics	Allows the use of diacritics for languages such as the accent or cedilla.
Automatic Language Detection	Specifies whether to always use automatic language detection when indexing content and properties.
Allow Voice Recording	Allow the end users to record voice recordings.
Require Device Encryption	<p>Encrypt all data stored on the device to prevent an end user from accessing readable, sensitive information.</p> <p>Important If you select this feature, you cannot return to not encrypting device data by simply deselecting the checkbox. In order to return the device to an unencrypted state, you must restore the device to factory settings (i.e., device wipe).</p>
Require Strict Safe Search	Require searches to use the strict safe search setting.
Allow Non-Microsoft Store Trusted Applications	Allows the downloading and installation of applications that are not trusted by the Microsoft Store.
Allow Developer Unlock	Allows the user of the Developer Unlock setting for sideloading applications onto devices.
Allow Shared Among Multiple Users of the Same App	Allows sharing of data between multiple users of an app.
Restrict App Data to System Volume	Restricts app data to the same volume as the OS instead of secondary volumes or removable media.
Restrict Installation of Applications to System Drive	Restricts the installation of apps to the system drive instead of secondary drives or removable media.
Allow Auto Connect to Wi-Fi Sense Hotspots	Allow the device to automatically connect to Wi-Fi hotspots using the Wi-Fi Sense functionality.
Allow Cellular Data Roaming	Allow cellular data usage while roaming.
Allow Internet Sharing	Allow Internet sharing between devices.
Allow Manual VPN Configuration	Allow creation of VPN connections.
Allow Manual Wi-Fi Configuration	Allow connections to Wi-Fi outside of the MDM server installed networks.
VPN Over Cellular	Allow the device to create a VPN over cellular networks.
VPN Roaming over Cellular	Allow the device to create a VPN while roaming over cellular networks.
Wi-Fi	Allows the users to connect to Wi-Fi.

Settings	Descriptions
Allow Wi-Fi Hotspots Reporting	Allow Wi-Fi Hotspots information reporting to Microsoft. Once disallowed, the user cannot turn this function on.
WLAN Scan Frequency	Select the frequency of scans when the device searches for Wi-Fi networks to connect to.
Cellular App Download Limit	Set the application file size limit to prevent the users from downloading large apps over cellular data.
Cookies	Allows the use of cookies.
Do Not Track	Allows the sending of Do Not Track requests.
Password Manager	Allows the use of the password manager to store website credentials.
SmartScreen Filter	Allows the use of the SmartScreen Filter to protect devices from malicious sites and downloads.

- 6 Select **Save & Publish** when you are finished to push the profile to the devices.

Configure Wi-Fi Payloads (Windows Phone)

Create a Wi-Fi profile to connect devices to hidden, encrypted, or password-protected corporate networks. Wi-Fi profiles are useful for end users who travel to various office locations that have unique wireless networks or for automatically configuring devices to connect to the appropriate wireless network.

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.
- 2 Select **Windows** and then select **Windows Phone**.
- 3 Configure the profile's **General** settings.
- 4 Select the **Wi-Fi** profile.
- 5 Configure the **General** settings, including:

Settings	Descriptions
Service Set Identifier	Enter an identifier that is associated with the name (SSID) of the desired Wi-Fi network.
Hidden Network	Enable if the network is not open to broadcast.
Auto-Join	Enable to set the device to automatically join the network.
Security Type	Use the drop-down menu to select the security type (e.g., WPA2 Personal) for the Wi-Fi network.
Encryption	Use the drop-down menu to specify if data transmitted using the Wi-Fi connection is encrypted. Displays based on the Security Type .

Settings	Descriptions
Password	<p>Enter the password required to join the Wi-Fi network.</p> <p>Select the Show Characters check box to disable hidden characters within the field.</p> <p>Displays based on the Security Type.</p>
Proxy	Enable to configure proxy settings for the Wi-Fi connection.
URL	Enter the URL for the proxy.
Port	Enter the port for the proxy.
Protocols	<p>Select the type of protocols to use:</p> <ul style="list-style-type: none"> ■ Certificate ■ EAP-TTLS ■ PEAP-MsChapv2 ■ Custom <p>This section displays when the Security Type is set to WPA Enterprise or WPA2 Enterprise.</p>
Inner Identity	<p>Select the method of authentication through EAP-TTLS:</p> <ul style="list-style-type: none"> ■ Username/Password ■ Certificate <p>This section displays when the Protocols field is set to EAP-TTLS or PEAP-MsChapv2.</p>
Require Crypto Binding	<p>Enable to require cryptographic binding on both authentications.</p> <p>This limits man-in-the-middle attacks.</p>
Use Windows Log On Credentials	<p>Enable to use the Windows log on credentials are the username/password to authenticate.</p> <p>Displays when Username/Password is set as the Inner Identity.</p>
Identity Certificate	<p>Select an Identity Certificate, which you can configure using the Credentials payload. For more information, see Configure a Credentials Profile (Windows Phone)</p> <p>Displays when Certificate is set as the Inner Identity.</p>
Trusted Certificates	<p>Select Add to add Trusted Certificates to the Wi-Fi profile.</p> <p>This section displays when the Security Type is set to WPA Enterprise or WPA2 Enterprise.</p>
Allow Trust Exceptions	Enable to allow trust decisions to be made by the user through a dialog.

6 Select **Save & Publish** to push the profile to devices.

VPN Profile (Windows Phone)

AirWatch supports configuring device VPN settings so end users can remotely and securely access your organizations internal network. The VPN profile provides granular VPN settings control including specific VPN provider settings and Per-App VPN access.

AirWatch supports specific VPN connection types for various third-party VPN providers, including:

■ IKEv2	■ F5 Edge Client
■ L2TP	■ Juniper Pulse
■ PPTP	■ Sonic Wall Mobile Connect
■ Check Point Mobile	■ Automatic
■ Cisco AnyConnect	■ VMware Tunnel

Per-app VPN

Per-app VPN allows you to configure VPN traffic rules based on specific applications. When configured, the VPN can automatically connect when a specified app is launched and send the application traffic through the VPN traffic but no traffic from other applications. With this flexibility, you can ensure that your corporate data remains secure while not limiting devices access to the Internet at large.

Watch a tutorial video explaining how to configure the Windows VPN profile for Per-app VPN: <https://support.air-watch.com/articles/115001664668>

Each rule group under the Per-App VPN Rules section uses the logical OR operator. So if traffic matches any of the set policies, it is allowed through the VPN.

VPN TRAFFIC RULES

Per-app VPN Rules ⓘ

+ Add New Filter		

Filter Types follow AND logic operator

+ Add New Per App VPN Rule

The applications for which Per-app VPN traffic rules apply can be legacy Windows applications such as EXE files or modern apps downloaded from the Microsoft Store. By designating specific applications to start and use the VPN connection, only the traffic from those apps uses the VPN and not all device traffic. This logic allows you to keep corporate data secure while reducing the bandwidth sent through your VPN.

To help you reduce VPN constraint, you can set DNS routing rules for the Per-app VPN connection. These routing rules limit traffic sent through the VPN to only that traffic that matches the rules. The logic rules use the AND operator so if you set an IP Address, Port, and IP Protocol, the traffic must match EACH of these filters to pass through the VPN.

Per-app VPN allows you to create granular, detailed control over your VPN connections on an app by app basis.

Configure a VPN Profile (Windows Phone)

Configure device VPN settings to remotely and securely access corporate infrastructure. You can also configure Per-app VPN connections that limit traffic through the VPN to specific applications and set the VPN to automatically connect whenever the specified application is launched.

This payload is only available to devices using Windows 10 Mobile or Windows 10 Mobile. If you want to use this payload, you must download and install the free update.

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.
- 2 Select **Windows** and then select **Windows Phone**.
- 3 Configure the profile's **General** settings.
- 4 Select the **VPN** payload.
- 5 Configure the VPN settings.

Settings	Description
Connection Name	Enter the name of the VPN connection.
Connection Type	Select the type of VPN connection: The connection type will support all third-party VPN providers available on the Windows store.
Server	Enter the VPN server, hostname, or IP Address.
Advanced Connection Settings	Enable to configure advanced routing rules for device VPN connections.
Routing Addresses	Select Add to enter the IP Addresses and Subnet Prefix Size of the VPN server. You may add additional routing addresses as needed.
DNS Routing Rules	Select Add to enter the Domain Name on which the VPN server is hosted. Enter the DNS Servers and Web Proxy Servers to use for each specific domain.
Routing Policy	Select Split Tunnel to allow traffic to use the VPN or the local network connection. Select Force Tunnel to force all traffic through the VPN.
Proxy	Select Auto Detect to automatically detect any proxy servers used by the VPN. Select Manual to configure the proxy server.

Settings	Description
Server	Enter the IP Address for the proxy server. Displays when Proxy is set to Manual .
Proxy Server Config URL	Enter the URL for the proxy server configuration settings. Displays when Proxy is set to Manual .
Bypass proxy for local	Enable to bypass the proxy server when the device detects it is on the local network.
Authentication Type	Select the authentication protocol for the VPN: <ul style="list-style-type: none"> ■ EAP – Allows for various authentication methods. ■ Machine Certificate – Detects a client certificate in the device certificate store to use for authentication.
Protocols	Select the type of EAP authentication: <ul style="list-style-type: none"> ■ EAP-TLS – Smart Card or client certificate authentication ■ EAP-MSCHAPv2 – Username and Password ■ EAP-TTLS ■ PEAP ■ Custom Configuration – Allows all EAP configurations
Credential Type	Select Use Certificate to use a client certificate. Select Use Smart Card to use a Smart Card to authenticate. Displays when EAP Type is set to EAP-TLS .
Simple Certificate Selection	Enable to simplify the list of certificates from which the user selects. The certificates are grouped by the entity that the certificate was issued for and the most recently issued certificate is presented. Displays when EAP Type is set to EAP-TLS .
Use Windows Log On Credentials	Enable to use the same credentials as the Windows device. Displays when EAP Type is set to EAP-MSCHAPv2 .
Identity Privacy	Enter the value to send servers before the client authenticates the server's identity. Displays when EAP Type is set to EAP-TTLS .
Inner Authentication Method	Select the authentication method for inner identity authentication. Displays when EAP Type is set to EAP-TTLS .
Enable Fast Reconnect	Enable to reduce the delay in time between an authentication request by a client and the response from the server. Displays when EAP Type is set to PEAP .
Enable Identity Privacy	Enable to protect the user identity until the client authenticates with the server.
Per-app VPN Rules	Select Add to add traffic rules for specific Legacy and Modern applications. For more information on Per-app VPN, see VPN Profile (Windows Phone) .
Application ID	Enter the application package family name to specify the app the traffic rules apply to. <ul style="list-style-type: none"> ■ Package Family Name example: AirWatchLLC.AirWatchMDMAgent_hwcww4rx2gx4
VPN On Demand	Enable to have the VPN connection automatically connect when the application is launched.

Settings	Description
Routing Policy	<p>Select the routing policy for the app.</p> <ul style="list-style-type: none"> ■ Allow Direct Access to External Resources allows for both VPN traffic and traffic through the local network connection. ■ Force All Traffic Through VPN forces all traffic through the VPN.
DNS Routing Rules	<p>Enable to add DNS routing rules for the app traffic.</p> <p>Select Add to add Filter Types and Filter Values for the routing rules. Only traffic from the specified app that matches these rules can be sent through the VPN.</p> <ul style="list-style-type: none"> ■ IP Address: A list of comma separated values specifying remote IP address ranges to allow. ■ Ports: A list of comma separated values specifying remote port ranges to allow. For example, 100-120, 200, 300-320. Ports are only valid when the protocol is set to TCP or UDP. ■ IP Protocol: Numeric value from 0-255 representing the IP protocol to allow. For example, TCP = 6 and UDP = 17. <p>For more information on how these filters and policies function and the logic used, see VPN Profile (Windows Phone).</p>
Device Wide VPN Rules	<p>Select Add to add traffic rules for the entire device.</p> <p>Select Add to add Filter Types and Filter Values for the routing rules. Only traffic that matches these rules can be sent through the VPN.</p>
Remember Credentials	Enable to remember the end user's login credentials.
Always On	Enable to force the VPN connection to always be on. This will turn the VPN connection back on when the network connection disconnects and reconnects.
VPN Lockdown	Enable to force the VPN to always be on, never be disconnected, disable any network access if the VPN is not connected, and prevent connection or modification to other VPN profiles.
Trusted Network	Enter, separated by commas, trusted network addresses. The VPN does not connect when a trusted network connection is detected.
WP8 Split Tunnel	<p>Enable to allow end users to use a split tunnel VPN.</p> <p>This field applies to Windows 10 Mobile devices only.</p>
Bypass for Local	<p>Enable to bypass the VPN connection for local intranet traffic. For example, you do not use the VPN connection if you are also connected to your work network connection at the office.</p> <p>This field applies to Windows 10 Mobile devices only.</p>
Connection Type	<p>Select the connection type you want to allow.</p> <p>Always ON leaves the VPN connection running at all times.</p> <p>This field applies to Windows 10 Mobile devices only.</p>
Trusted Network Detection	<p>Enable to use Trusted Network Detection when connecting to the VPN.</p> <p>This field applies to Windows 10 Mobile devices only.</p>
Idle Disconnection Time	<p>Set the maximum amount of time that can pass without connectivity requests before automatically disconnecting the VPN.</p> <p>This field applies to Windows 10 Mobile devices only.</p>
Allows Apps	<p>Select Add to define apps to have all their traffic secured over the VPN.</p> <p>You may add as many apps as you like.</p>

Settings	Description
Allowed Networks	Select Add to define networks. All traffic over configured networks are secured over the VPN. You may add as many networks as you like.
Excluded Apps	Select Add to define excluded apps. All traffic to these apps are NOT secured over the VPN. You may add as many excluded apps as you like.
Excluded Networks	Select Add to define excluded networks. All traffic over excluded networks are NOT secured over the VPN. You may add as many excluded networks as you like.
DNS Suffix Search List	Select Add to define the DNS Suffix Search List. DNS suffixes are appended to short name URLs for DNS resolution and connectivity. You may add as many DNS suffixes as you like.

6 Select **Save & Publish**.

Configure an Email Profile (Windows Phone)

The Email profile sets up end user IMAP/POP3 email accounts and sends configurations directly to their devices.

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.
- 2 Select **Windows** and then select **Windows Phone**.
- 3 Configure the profile's **General** settings.
- 4 Select the **Email** profile.
- 5 Configure the Email settings.

Settings	Descriptions
Email Service Name	Enter the email service provider.
Name	Enter the name of the email account to appear in the mail client.
Email Address	Enter the user email address. You can use lookup values to use the device specific value.
Domain	Enter the user's domain.
Reply Address	Enter the email address that replies are sent from. You can use lookup values to use the device specific value.
Maximum Email Truncation Size (bytes)	Enter the maximum amount an email is truncated in bytes.
Maximum Attachment Size (KB)	Enter the maximum attachment size allowed to be sent.

Settings	Descriptions
Past Days of Emails to Download	Enter the number of days of past emails to download when the account syncs for the first time on the device.
Use SSL	Enable to use Secure Socket Layer when receiving emails.
Protocol	Select the email protocol for incoming mail.
Host Name	Enter the email server URL for incoming mail.
Use SSL	Enable to use Secure Socket Layer when sending emails.
Protocol	Select the email protocol for outgoing mail.
Host Name	Enter the email server URL for outgoing mail.
Enable Authentication	Enable to secure IMAP/POP3 email traffic on devices by enforcing authentication to access these email accounts.
Allow Alternative SMTP Domain	Enable to configure an alternative SMTP domain.
Alternative SMTP Domain	Enter the alternate SMTP domain. Displays when Allow Alternative SMTP Domain is enabled.
Alternative SMTP Username	Enter the username for the alternate SMTP domain. Displays when Allow Alternative SMTP Domain is enabled.
Alternative SMTP Password	Enter the password for the alternative SMTP domain. Displays when Allow Alternative SMTP Domain is enabled.

- 6 Select **Save & Publish** to push the profile to devices.

Exchange ActiveSync Profiles (Windows Phone)

The Exchange ActiveSync profiles allow you to configure your Windows Phone devices to access your Exchange ActiveSync server for email and calendar use.

Strongly consider only using certificates signed by a trusted third-party certificate authority (CA). Mistakes in your certificates expose your otherwise secure connections to potential man-in-the-middle attacks. Such attacks degrade the confidentiality and integrity of data transmitted between product components, and might allow attackers to intercept or alter data in transit.

The Exchange ActiveSync profile supports the native mail client and AirWatch Inbox for Windows Phone. The configuration changes based on which mail client you use.

Configure an Exchange ActiveSync Profile (Windows Phone)

Create an Exchange ActiveSync profile to give Windows Phone devices access to your Exchange ActiveSync server for email and calendar use.

To configure Exchange ActiveSync payloads, follow the steps detailed below:

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.
- 2 Select **Windows** and then select **Windows Phone**.

- 3 Configure the profile's **General** settings.
- 4 Select the **Exchange ActiveSync** profile.
- 5 Configure the Exchange settings:

Settings	Descriptions
Mail Client	Select the mail client for the exchange profile.
Account Name	Enter the name for the account to display in the mail client.
Exchange ActiveSync Host	Enter the public host name or server name hosting your Exchange ActiveSync.
Use SSL	Select to send all information through the Secure Socket Layer.
Domain	Enter the end-user's domain. You can use the Lookup Values instead of creating individual profiles for each end user.
Username	Enter the end-user's username. You can use the Lookup Values instead of creating individual profiles for each end user.
Email Address	Enter the end-user's email address. You can use the Lookup Values instead of creating individual profiles for each end user.
Password	Enter the password for the end user. You can use the Lookup Values instead of creating individual profiles for each end user.
Identity Certificate	Select (if desired) an Identity Certificate from the drop-down if you require the end user to pass a certificate in order to connect to the Exchange ActiveSync, otherwise select None (default). For more information needed to select a certificate for this payload, see Configure a Credentials Profile (Windows Phone) .
Next Sync Interval (Min)	Enter the number of minutes between syncs.
Past Days of Mail to Sync	Select the number of days of past mail to sync with device.
Diagnostic Logging	Select the type of diagnostic logging you want to gather.
Require Data Protection Under Lock Configuration	Enable to protect data when a device is pin locked. When the device is configured to use a pin lock, the protected data is encrypted using a separate enterprise key at all times. If someone gains access to the device pin lock, your organization's email and data are protected by a separate key.
Allow Email Sync	Allow the syncing of email. Disabling this setting will remove access to email through Exchange Active Sync.
Allow Contacts Sync	Allow the syncing of contacts.
Allow Calendar Sync	Allow the syncing of calendars.

- 6 Select **Save & Publish** to push the profile to devices.

Configure an EAS Profile for AirWatch Inbox (Windows Phone)

Create an Exchange ActiveSync profile to give Windows Phone devices access to your Exchange ActiveSync server for email and calendar use. The settings change when you use the AirWatch Inbox as your Windows Phone email client.

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.
- 2 Select **Windows** and then select **Windows Phone**.
- 3 Select **Windows** and then select **Windows Phone**.
- 4 Configure the profile's **General** settings.
- 5 Select the **Exchange ActiveSync** payload.

Settings	Descriptions
Mail Client	Set to AirWatch Inbox.
Exchange ActiveSync Host	Enter the public host name or server name hosting your Exchange ActiveSync.
Use SSL	Select the checkbox to send all information through the Secure Socket Layer.
Use S/MIME	Select the checkbox to store an end user's S/MIME certificate to be used with S/MIME enabled profiles.
Ignore SSL	Select the checkbox to allow the devices to ignore Secure Socket Layer errors from Hub processes.
Domain	Enter the end-user's email domain. You can use the Lookup Values instead of creating individual profiles for each end user.
Username	Enter the end-user's email username. You can use the Lookup Values instead of creating individual profiles for each end user.
Email Address	Enter the end-user's email address. You can use the Lookup Values instead of creating individual profiles for each end user.
Password	Enter the password for the end user. You can use the Lookup Values instead of creating individual profiles for each end user.
Identity Certificate	Select (if desired) an Identity Certificate from the drop-down if you require the end user to pass a certificate in order to connect to the Exchange ActiveSync, otherwise select None (default). For more information to select a certificate, see Configure a Credentials Profile (Windows Phone) .
Enable Calendar	Enable to allow the syncing of calendar events.
Enable Contacts	Enable to allow the syncing of contacts.
Sync Interval	Select the time interval between syncs to the EAS server.
Email Notifications	Select the type of notifications that display on the device.

Settings	Descriptions
Past Days of Mail to Sync	Select the number of days of past mail to sync with device.
Past Days of Calendar to Sync	Select the number of days of past calendar events to sync with device.
Email Signature	Enter the signature to use with all emails sent from this device.
Enable Signature Editing	Enable to allow end users to edit their signature.
Require Passcode	Enable to enter a passcode to protect the AirWatch Inbox application.
Type	<p>Select the type of passcode security.</p> <ul style="list-style-type: none"> ■ Passcode requires a string of numbers and letters to unlock the app. ■ Username and Password requires the end user to enter their login credentials to unlock the app.
Complexity	<p>Select the level of complexity of the passcode as either a simple numeric passcode or a more complex alphanumeric.</p> <p>Displays when the passcode Type is set to Passcode.</p>
Minimum Length	<p>Select the minimum number of characters the passcode can be.</p> <p>Displays when the passcode Type is set to Passcode.</p>
Allow Simple Value	<p>Enable to allow end users to create a simple passcode regardless of the passcode settings configured.</p> <p>Displays when the passcode Type is set to Passcode.</p>
Maximum Age	<p>Select the number of days until the passcode must be changed.</p> <p>Displays when the passcode Type is set to Passcode.</p>
History	<p>Select the number of previous passcodes to remember. A new passcode may not match a previous passcode that is stored in the history.</p> <p>Displays when the passcode Type is set to Passcode.</p>
Auto Lock When Device Locks	Enable to automatically lock the application when the device is locked.
Grace Period	Enter time in minutes that pass before the app automatically locks.
Maximum Number of Failed Attempts	Select the maximum number of failed attempts allowed before all data on the device is wiped.
Disable Copy-Paste	Enable the checkbox to disable the copy-paste functionality while using the application.
Disable Screen Capture	Enable the checkbox to disable the screenshot functionality while using the application.
Disable Attachments	Enable the checkbox to disable the use of attachments when sending emails.
Maximum Attachment Size (MB)	Enter the maximum size (in MB) of an attachment that can be uploaded.
Content Locker Only Attachments	Enable the checkbox to open the attachments that are attached only through Content Locker.
Restrict Domains	Enable to restrict the domains through whitelisting or blacklisting specific domains.

6 Select **Save & Publish**.

Configure Application Control (Windows Phone)

Create a profile of blacklisted and whitelisted applications to limit app access to your Windows Phone devices.

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.
- 2 Select **Windows** and then select **Windows Phone**.
- 3 Configure the profile **General** settings.
- 4 Select the **Application Control** payload.
- 5 Enable or disable the following settings to set the level of control for your application deployments:

Settings	Descriptions
Prevent Installation of Blacklisted Apps	Enable to prevent the installation enforce and the automatic removal of blacklisted apps defined in Configure an Application Group .
Only Allow installation of Whitelisted Apps	Enable to prevent the installation of any application that is not a whitelisted app defined in Configure an Application Group .

- 6 Select **Save & Publish**.

If you update your Application Group after publishing the profile, you must republish the profile for it to take effect on devices.

Configure an Application Group

Configure application groups, or app groups, so that you can use the groups in your compliance policies. Take set actions on devices that do not comply with the installing, updating, or removing applications.

You assign application groups to organization groups. When you assign the application group to a parent organization group, the child organization groups inherit the application group configurations.

Procedure

- 1 Navigate to **Apps & Books > Applications > Applications Settings > App Groups**.
- 2 Select **Add Group**.
- 3 Complete options on the **List** tab.

Setting	Description
Type	Select the type of application group you want to create depending on the desired outcome: allow applications, block applications, or require application installations. If your goal is to group custom MDM applications, select MDM Application . You must enable this option for it to display in the menu.
Platform	Select the platform for the application group.

Setting	Description
Name	Enter a display name for the application group in the Workspace ONE UEM console.
Add Application	Display text boxes that enable you to search for applications to add to the application group.
Application Name	Enter the name of an application to search for it in the respective app store.
Application ID	Review the string that automatically completes when you use the search function to search for the application from an app store.
Add Publisher - Windows Phone	Select for Windows Phone to add multiple publishers to application groups. Publishers are organizations that create applications. Combine this option with Add Application entries to create exceptions for the publisher entries for detailed whitelists and blacklists on Windows Phone.

- 4 Select **Next** to navigate to an application control profile. You must complete and apply an application control profile for Windows Phone. You can use an application control profile for Android devices.
- 5 Complete settings on the **Assignment** tab.

Setting	Description
Description	Enter the purpose of the application group or any other pertinent information.
Device Ownership	Select the type of devices to which the application group applies.
Model	Select device models to which the application group applies.
Operating System	Select operating systems to which the application group applies.
Managed By	View or edit the organization group that manages the application group.
Organization Group	Add more organization groups to which the application group applies.
User Group	Add user groups to which the application group applies.

- 6 Select **Finish** to complete configurations.

Assigned Access Profile (Windows Phone)

The Assigned Access profile limits access to specific functions and control features of Windows Phone 8.1 and Windows 10 Mobile devices. Use this profile to control the apps displayed on the front page or app list, the settings accessed, and the function of each hardware key.

Assigned Access enables an enterprise to provision a device into a state with a locked down user experience. The start screen can be customized with pinned applications, and the system buttons can be disabled or configured to have custom actions. You can also customize the settings panel to display only certain settings to the user.

Consider using the Application Control and the Assigned Access payloads together to ensure that your devices are controlled.

Caution The Assigned Access profile may cause devices to fail or lose connectivity and requires that the device is serviced at a repair center to reset it to factory settings. This profile is a one-way action and cannot be removed. Once this profile is published, your devices must be factory-reset to regain normal functionality.

Configure an Assigned Access Profile (Windows Phone)

Create an Assigned Access profile to limit access to the device settings and functions and set the location of applications on the start screen.

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.
- 2 Select **Windows** and then select **Windows Phone**.
- 3 Configure the profile **General** settings.
- 4 Select the **Assigned Access** profile and configure the following settings:

Settings	Descriptions
Add Application	Select to add a Windows 10 Mobile app to the device screen.
Application Name	Enter the name of the application that you want to configure and add to the device. Select the Search icon() to select the application from a list.
Identifier	Enter the alphanumeric identifier for the Windows app. This text box is automatically populated if you use the app lookup.
Pin to Start	Enable to pin the Live Tile to the Start screen. If the app is added but not pinned, it appears on the app list.
Size	Select the size of the Live Tile used on the front screen.
Column	Set the X-axis location of the Live Tile.
Row	Set the Y-axis location of the Live Tile.
Add Application	Select to add a Windows 10 Mobile app to the device screen.
Application Name	Select the application that you want to configure and add the device.
Pin to Start	Enable to pin the Live Tile to the Start screen. If the app is added but not pinned, it appears on the app list.
Size	Select the size of the Live Tile used on the front screen.
Column	Set the X-axis location of the Live Tile.
Row	Set the Y-axis location of the Live Tile.
Airplane Mode	Enable to allow access to the Airplane Mode settings screen.
Backup	Enable to allow access to the Backup settings screen.
Bluetooth	Enable to allow access to the Bluetooth settings screen.

Settings	Descriptions
Cellular & SIM	Enable to allow access to the Cellular & SIM settings screen.
Data Sense	Enable to allow access to the Data Sense settings screen.
Feedback	Enable to allow access to the Feedback settings screen.
Internet Sharing	Enable to allow access to the Internet Sharing settings screen.
NFC	Enable to allow access to the NFC settings screen.
Phone Update	Enable to allow access to the Phone Update settings screen.
Sync My Settings	Enable to allow access to the Sync My Settings settings screen.
VPN	Enable to allow access to the VPN settings screen.
Wi-Fi	Enable to allow access to the Wi-Fi settings screen.
About	Enable to allow access to the About settings screen.
Advertising ID	Enable to allow access to the Advertising settings screen.
Battery Saver	Enable to allow access to the Battery Saver settings screen.
Colors	Enable to allow access to the Colors settings screen.
Brightness	Enable to allow access to the Brightness settings screen.
Date and Time	Enable to allow access to the Date and Time settings screen.
Driving Mode	Enable to allow access to the Driving Mode settings screen.
Ease of Access	Enable to allow access to the Ease of Access settings screen.
Find My Phone	Enable to allow access to the Find My Phone settings screen.
Keyboard	Enable to allow access to the Keyboard settings screen.
Project My Screen	Enable to allow access to the Project My Screen settings screen.
Ringtones & Sounds	Enable to allow access to the Ringtones & Sounds settings screen.
Screen Rotation	Enable to allow access to the Screen Rotation settings screen.
Start and Theme	Enable to allow access to the Start and Theme settings screen.
USB	Enable to allow access to the USB settings screen.
Language	Enable to allow access to the Language settings screen.
Location	Enable to allow access to the Location settings screen.
Email and Accounts	Enable to allow access to the Email and Accounts settings screen.
Kids Corner	Enable to allow access to the Kids Corner settings screen.
Lock Screen	Enable to allow access to the Lock Screen settings screen.
Notifications & Actions	Enable to allow access to the Notifications & Actions settings screen.
Quiet Hours	Enable to allow access to the Quiet Hours settings screen.
Region	Enable to allow access to the Region settings screen.
Storage Sense	Enable to allow access to the Storage Sense settings screen.
Workplace	Enable to allow access to the Workplace settings screen.
Cortana	Enable to allow access to the Cortana settings screen.

Settings	Descriptions
Internet Explorer	Enable to allow access to the Internet Explorer settings screen.
Maps	Enable to allow access to the Maps settings screen.
Messaging	Enable to allow access to the Messaging settings screen.
Office	Enable to allow access to the Office settings screen.
People	Enable to allow access to the People settings screen.
Phone	Enable to allow access to the Phone settings screen.
Photos and Camera	Enable to allow access to the Photos and Camera settings screen.
Search	Enable to allow access to the Search settings screen.
Microsoft Store	Enable to allow access to the Microsoft Store settings screen.
Wallet	Enable to allow access to the Wallet settings screen.
Narrator	Enable to allow access to the Narrator settings screen.
Magnifier	Enable to allow access to the Magnifier settings screen.
High Contrast	Enable to allow access to the High Contrast settings screen.
Closed Captions	Enable to allow access to the Closed Captions settings screen.
More Options	Enable to allow access to the More Options settings screen.
Camera	Enable to allow use of the Camera hardware key. You can set different behavior for Windows 10 Mobile devices and Windows 10 Mobile devices.
Search	Enable to allow use of the Search hardware key. Enable Remap to change what application the hardware key starts when pressed. You can set different behavior for Windows 10 Mobile devices and Windows 10 Mobile devices.
Start	Enable to allow use of the Start hardware key. You can set different behavior for Windows 10 Mobile devices and Windows 10 Mobile devices.
Start Menu Grid Layout>	Choose the layout option for the start screen. This option controls the number of columns visible on the start menu. High-resolution devices have the option of 4 or 6 columns while lower resolutions display 4 columns.
Action Center	Enable to allow the use of the Action Center.
Allow User to Resize Tiles	Enable to allow the user to resize tiles on the home screen.
Menu Items	Enable to allow the user to access the context menu, which is displayed when a user presses and holds an application in the All Programs list.
Theme Background & Color	Select Admin Enabled to set the theme background and color for the device.
Background Color	Select Light or Dark for the device background color. This option displays if Theme Background & Color is set to Admin Enabled .
Foreground Accent Color	Select the foreground accent color from the available drop-down menu. This option displays if Theme Background & Color is set to Admin Enabled .

Settings	Descriptions
Time Zone Settings	Set to Admin Enabled to set the time zone for the device.
Time Zone	Select the device time zone from the available drop-down menu. This option displays if Time Zone Settings is set to Admin Enabled .

- 5 Select **Save & Publish** to push the profile to devices.

Windows Phone Assigned Access Start Screen Layout

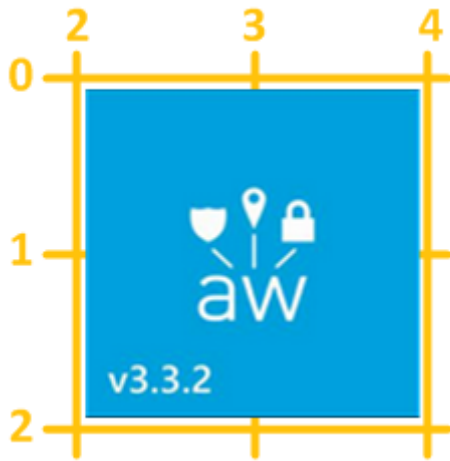

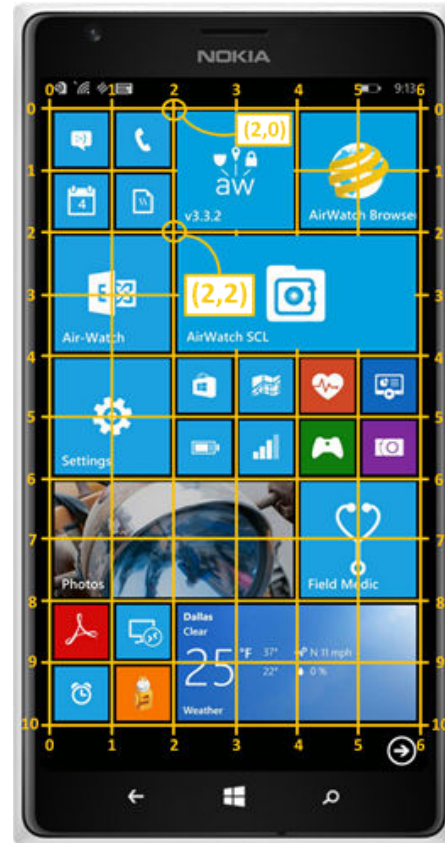

The Assigned Access profile supports pinning applications to specific location on the device start screen.

To pin or allow certain applications to the start screen, you must select the application from the drop-down menu in the Assigned Access payload and then configure their placement. Refer to the image to the right to understand how to place an application on the start screen.

The start screen can be either small or large size (configurable in the Assigned Access payload). The small screen size has a total of 4 columns, while the large screen size has 6 columns.

The rows on a start screen are infinite. You can have as few or as many applications on the start screen as you want. Applications can have the sizing option of small, medium, or large:

- Small applications are 1x1
- Medium applications are 2x2
- Large applications are 4x2

In the image to the left, the Workspace ONE Intelligent Hub is placed on the start screen. Measure the column and row values for where this application is placed. Referring to the coordinate system, the top left corner (used to place the apps position) is located at (2,0). When the Assigned Access profile is configured, input the column value of 2 and row value of 0.

Credentials Profile (Windows Phone)

A Credentials profile allows you to push Root, Intermediate, and Client certificates to support any Public Key Infrastructure (PKI) and certificate authentication use case. The profile pushes configured credentials to the proper credentials store on the Windows Phone device.

Even with strong passcodes and other restrictions, your infrastructure remains vulnerable to brute force, dictionary attacks, and employee error. For greater security, you can implement digital certificates to protect corporate assets. To use certificates in this way, you must first configure a Credentials payload with a certificate authority, and then configure your Wi-Fi and VPN payloads. Each payload has settings for associating the certificate authority defined in the Credentials payload.]

The Credentials profile also allows you to push S/MIME certificates to devices. These certificates are uploaded under each user account and controlled by the Credentials profile.

Windows Phone 8.0 or 8.1 devices using the Credentials payload to push Personal Certificates need the Workspace ONE Intelligent Hub downloaded. End users are required to install any certificates as mentioned in [Install a Personal Certificate on a Windows 10 Mobile Device](#). The Root and Intermediate certificates install silently onto the device without the Workspace ONE Intelligent Hub or the end-user interaction.

Configure a Credentials Profile (Windows Phone)

A Credentials profile pushes certificates to devices for use in authentication. AirWatch supports configuring credentials for personal, intermediate, trusted root, trusted publisher, and trusted people certificate stores.

Prerequisites

To push certificates onto the devices, you need to configure a Credentials payload as part of the profiles that you create for EAS, Wi-Fi, and VPN settings.

Note For Windows 8.0 and 8.1, the Root and Intermediate certificates silently install to the device without interaction from the end user. The Personal Certificates cannot be installed silently with the Credentials payload and require end-user interaction. Please see [Install a Personal Certificate on a Windows 10 Mobile Device](#) section for more information. To silently install Personal Certificates without end-user involvement, see the [Configure a SCEP Payload \(Windows Phone\)](#).

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.
- 2 Select **Windows** and then select **Windows Phone**.
- 3 Configure the profile's **General** settings.

4 Select the **Credentials** payload and configure the following settings:

Settings	Descriptions
Credential Source	<p>Select the credential source as either an Upload or a Defined Certificate Authority, or User Certificate</p> <p>The remaining payload options are source-dependent.</p> <ul style="list-style-type: none"> ■ If you select Upload, you must upload a new certificate. If you select Defined Certificate Authority, you must choose a predefined certificate authority and Template. ■ If you select User Certificate, you must select how the S/MIME certificate is used.
Upload	<p>Select to navigate to the desired credential certificate file and upload it to the AirWatch Console.</p> <p>This setting displays when Upload is selected as the Credential Source.</p>
Certificate Authority	<p>Use the drop-down menu to select a predefined certificate authority.</p> <p>This setting displays when Defined Certificate Authority is selected as the Credential Source.</p>
Certificate Template	<p>Use the drop-down menu to select a predefined certificate template specific to the selected certificate authority.</p> <p>Displays when Defined Certificate Authority is selected as the Credential Source.</p>
Export Private Key	<p>Select Allow to let end users export certificates using Windows Certificate Manager or select Don't Allow to prohibit end users from exporting certificates.</p>
Key Location	<p>Select the location for the certificate private key:</p> <ul style="list-style-type: none"> ■ TPM If Present – Select to store the private key on a Trusted Platform Module if one is present on the device, otherwise store it in the software. ■ TPM Required – Select to store the private key on a Trusted Platform Module. If a TPM is not present, the certificate does not install and an error displays on the device. ■ Software – Select to store the private key in the device software. ■ Passport – Select to save the private key within Microsoft Passport. This requires the AirWatch Protection Agent to be installed on the device.
Certificate Store	<p>Select from the drop-down menu the appropriate certificate store for the credential to reside in on the device:</p> <ul style="list-style-type: none"> ■ Personal – Select to store personal certificates. ■ Intermediate – Select to store certificates from Intermediate Certificate Authorities. ■ Trusted Root – Select to store certificates from Trusted Certificate Authorities as well as root certificates from your organization and Microsoft. ■ Trusted Publisher – Select to store certificates from Trusted Certificates Authorities that are trusted by software restriction policies. ■ Trusted People – Select to store certificates from trusted people or end entities that are explicitly trusted. Often these are self-signed certificates or certificates explicitly trusted in an application such as Microsoft Outlook.
Store Location	<p>Use the drop-down menu to select User or Machine to define where the certificate is located.</p>
S/MIME	<p>Select whether the S/MIME certificate is for encryption or signing.</p>

- 5 Select **Save & Publish** to push the profile to devices.

Install a Personal Certificate on a Windows 10 Mobile Device

After you configure a Credentials profile for a certificate in the personal store, install the certificate onto a Windows 10 Mobile device. Credentials provide authentication for end users to access corporate resources.

Procedure

- 1 Open the Workspace ONE Intelligent Hub on the device.
- 2 Navigate to the **My Device** section of the Workspace ONE Intelligent Hub.
- 3 Tap the **Contextual** menu (three dots) at the bottom right corner of the screen.
- 4 Tap **Install certificate(s)**. The **Certificate(s)** screen displays, listing all the certificates that the AirWatch Admin pushed in a payload.
 - a If a certificate contains a password, **Copy Password** option is displayed. Tap **Copy Password** to copy the password to the device's clipboard.
 - b If an email certificate does not display, verify if it was pushed to the device from the AirWatch Console.
- 5 Tap **Install Certificate** under the certificate you want to install on the device. If the certificate does not require a password, the certificate installs. Otherwise, the device advances to the **Install Certificate?** screen as shown in the image.
- 6 If you had copied a certificate password, tap **Paste** on the left side of the screen. This action inserts the certificate password you copied from the device's clipboard into the password field as shown. Tap **Done**.
- 7 Tap **Ok** on the **Your certificates are installed** screen.

The email certificate is now installed on the device and displays on the Certificate(s) screen of the device. The installation is successful when the device user can authenticate an email client with the Exchange server.

SCEP Profile (Windows Phone)

Simple Certificate Enrollment Protocol (SCEP) profiles allow you to install certificates onto devices silently without the need of end-user interaction.

Even if you protect your email, Wi-Fi, and VPN with strong passcodes, your infrastructure remains vulnerable to brute force, dictionary attack, and employee error. For greater security, you can implement digital certificates to protect corporate assets. To use SCEP to install these certificates to devices silently, you must first define a certificate authority, then configure a **SCEP** payload alongside your **EAS**, **Wi-Fi**, or **VPN** payload. Each payload has settings for associating the certificate authority defined in the SCEP payload.

To push certificates to devices, you must configure a **SCEP** payload as part of the profiles you created for EAS, Wi-Fi, and VPN settings.

Configure a SCEP Payload (Windows Phone)

A SCEP profile silently installs certificates onto end user devices for use with device authentication.

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.
- 2 Select **Windows** and then select **Windows Phone**.
- 3 Configure the profile's **General** settings.
- 4 Select the **SCEP** profile.
- 5 Configure the SCEP settings, including:

Settings	Descriptions
Credential Source	This drop-down menu is always set to defined certificate authority.
Certificate Authority	Select the certificate authority you want to use.
Certificate Template	Select the template available for the certificate.
Issuer	Enter the issuer of the certificate. The issuer can be found in the subject line of the certificate.
Store Location	Select where the SCEP stores on the machine: <ul style="list-style-type: none"> ■ Context User – Stores the SCEP with the specific user. ■ Context Machine – Stores the SCEP for all users on the machine.

- 6 Configure the Wi-Fi, VPN, or EAS profile.
- 7 Select **Save & Publish** when you are finished to push the profile to devices.
- 8

What to do next

Combine SCEP payloads with a Wi-Fi, VPN, or an EAS payload when you create a profile.

For more information on these payloads:

- [Exchange ActiveSync Profiles \(Windows Phone\)](#)
- [VPN Profile \(Windows Phone\)](#)
- [Configure Wi-Fi Payloads \(Windows Phone\)](#)

Windows Hello Profile (Windows Phone)

Microsoft Passport provides a secure alternative to using passwords for security. The Windows Hello profile configures Microsoft Passport for your Windows 10 Mobile devices so end users can access your data without sending a password.

Protecting devices and accounts with a user name and password creates potential security exploits. Users can forget a password or share it with non-employees, putting your corporate data at risk. Using Passport, Windows Mobile 10 devices securely authenticate the user to applications, Web sites, and networks on the behalf of the user without sending a password. The user does not need to remember passwords, and man-in-the-middle attacks are less likely to compromise your security.

Passport requires users to verify possession of a Windows 10 device before it authenticates with either a PIN or Windows Hello biometric verification. Once authenticated with Passport, the device gains instant access to Web sites, applications, and networks.

Important Windows Hello requires Azure AD integration to work.

Configure a Windows Hello Profile (Windows Phone)

Microsoft Passport provides a secure alternative to using passwords for security. The Windows Hello profile configures Microsoft Passport for your Windows 10 Mobile devices so end users can access your data without sending a password.

Create a Windows Hello profile to configure Microsoft Passport for your Windows Phone devices so end users can access your organization's applications, websites, and networks without entering a password.

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.
- 2 Select **Windows** and then select **Windows Phone**.
- 3 Configure the profile's **General** settings.
- 4 Select the **Windows Hello** profile.
- 5 Configure the **Passport** settings:

Settings	Descriptions
Biometric Gesture	Enable to allow end users to use the device biometric readers.
TPM	Set to Require to disable Passport use without a Trusted Protection Module installed on the device.
Minimum PIN Length	Enter the minimum number of digits a PIN must contain.
Maximum PIN Length	Enter the maximum number of digits a PIN can contain.
Digits	Set the permissions level for using digits in the PIN.
Upper Case Letters	Set the permissions level for using upper case letters in the PIN.
Lower Case Letters	Set the permissions level for using lower case letters in the PIN.
Special Characters	Set the permissions level for using special characters (! " # \$ % & ' () * + , - . / : ; < = > ? @ [\] ^ _ ` { } ~) in the PIN.

- 6 Select **Save & Publish** to push the profile to devices.

Create a Windows Licensing Profile (Windows Phone)

Configure a Windows Licensing profile to provide your Windows 10 devices with a license key. This license key upgrades a consumer device to Windows 10 Mobile Enterprise edition and allows you to use additional functionality.

This upgrade process cannot be reversed. Use caution before pushing this profile to employee-owned devices.

Prerequisites

For Windows 10 Mobile devices, you must acquire a valid XML License file from the Microsoft Volume Licensing Service Center.

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.
- 2 Select **Windows** and then select **Windows Phone**.
- 3 Configure the profile's **General** settings.
- 4 Select the **Windows Licensing** profile.
- 5 Select **Upload** to select a valid XML license file.

Acquire this file from the Microsoft Volume Licensing Service Center.

- 6 Select **Save & Publish** to push the profile to devices.

To check if the licensing upgrade was successful, navigate on the phone to **Settings > System > About** and check under **Device Information** for **Software: Windows 10 Mobile Enterprise**.

Data Protection Profile (Windows Phone)

The Data Protection profile configures rules to control how enterprise applications access data from multiple sources in your organization. Using Data Protection ensures that your data is only accessible by secured, approved applications.

Important Data Protection is currently a tech preview feature. Consider limiting your use of this feature for testing purposes only. Data Protection should not be used in a production environment. Features are not final and are subject to change at any time.

With personal and work data on the same device, accidental data disclosure is possible through services that your organization does not control. With the Data Protection payload, AirWatch controls how your enterprise data moves between applications to limit leakage with a minimal impact on end users. AirWatch uses the Microsoft Windows Information Protection (WIP) feature to protect your Windows 10 Mobile devices.

Data Protection works by whitelisting enterprise applications to give them permission to access enterprise data from protected networks. If end users move data to non-enterprise applications, you can act based on the selected enforcement policies.

WIP treats data as either unencrypted personal data or corporate data to protect and encrypt. Applications whitelisted for Data Protection fall into four different types. These types determine how the app interacts with protected data.

- **Enlightened Apps** – These apps fully support WIP functionality. Enlightened apps can access both personal and corporate data without issues. If data is created with an enlightened app, you can save the data as unencrypted personal data or encrypted corporate data. You can restrict users from saving personal data with enlightened apps using the Data Protection profile.
- **Allowed** – These apps support WIP-encrypted data. Allowed apps can access both corporate and personal data but the apps save any accessed data as encrypted corporate data. Allowed apps save personal data as encrypted corporate data that cannot be accessed outside of WIP-approved apps. Consider slowly whitelisting allowed apps on a case-by-case basis to prevent issues accessing data. Reach out to software providers for information on WIP approval.
- **Exempt** – You determine which apps are exempt from WIP policy enforcement when you create the Data Protection profile. Exempt any apps that do not support WIP-encrypted data. If an app does not support WIP-encryption, the apps break when attempting to access encrypted corporate data. No WIP policies apply to exempt apps. Exempt apps can access unencrypted personal data and encrypted corporate data. Because exempt apps access corporate data without WIP policy enforcement, use caution when whitelisting exempt apps. Exempt apps create gaps in data protection and leak corporate data.
- **Not Allowed** – These apps are not whitelisted or exempted from WIP policies and cannot access encrypted corporate data. Not allowed apps can still access personal data on a WIP-protected device.

Important The Data Protection profile requires Windows Information Protection (WIP). This feature requires the Windows Anniversary Update. Consider testing this profile before deploying to production.

Configure a Data Protection Profile (Windows Phone)

Create the Data Protection (Preview) profile to use the Microsoft Windows Information Protection feature to limit user and application access to your organizational data to approved networks and applications. You can set detailed controls over data protection.

Data Protection is currently a tech preview feature. AirWatch recommends limiting your use of this feature for testing purposes only. Data Protection should not be used in a production environment. Features are not final and are subject to change at any time.

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.
- 2 Select **Windows** and choose **Windows Phone** as the platform.
- 3 Select **Device Profile**.
- 4 Configure the profile **General** settings.
- 5 Select the **Data Protection** payload.

6 Configure the Enterprise Data Protection settings:

Settings	Descriptions
Add	Select to add enterprise applications to the enterprise allowed list. Applications added here are trusted to use enterprise data.
App Type	Select either Store App or Store App Publisher. Selecting a publisher whitelists all apps from the publisher.
Name	Enter the app name. If the app is a Microsoft Store app, select the Search icon (🔍) to search for the app Package Family Name (PFN).
Identifier	Enter the package family name for the store app or the app publisher name.
Exempt	Select the check box if the app does not support full data protection but still needs access to enterprise data. Enabling this option exempts the app from data protection restrictions. These apps are often legacy apps not yet updated for data protection support. Creating exemptions creates gaps in data protection. Only create exemptions when necessary.
Primary Domain	Enter the primary domain that your enterprise data uses. Data from protected networks is accessible by enterprise applications only. Attempting to access a protected network from an application not on the enterprise allowed list results in enforcement policy action. Enter domains in lowercase characters only.
Enterprise Protected Domain Names	Enter a list of domains (other than your primary domain) used by the enterprise for its user identities. Separate the domains with the vertical bar character (). Enter domains in lowercase characters only.
Enterprise IP Ranges	Enter the enterprise IP ranges that define the Windows 10 devices in the enterprise network. Data that comes from the devices in range are considered part of the enterprise and are protected. These locations are considered a safe destination for enterprise data sharing.
Enterprise Network Domain Names	Enter the list of domains that are the boundaries of the enterprise network. Data from a listed domain that is sent to a device is considered enterprise data and is protected. These locations are considered a safe destination for enterprise data sharing.
Enterprise Proxy Servers	Enter the list of proxy server that the enterprise can use for corporate resources.
Enterprise Cloud Resources	Enter the list of enterprise resource domains hosted in the cloud that need to be protected by routing through the enterprise network through a proxy server (on port 80). If Windows cannot determine whether to allow an app to connect to a network resource, it will automatically block the connection. If you want Windows to default to allow the connections, add the /*AppCompat*/ string to the setting. For example: <div>www.air-watch.com /*AppCompat*/</div> Only add the /*AppCompat*/ string once to change the default setting.
Application Data Protection Level	Set the level of protection and the actions taken to protect enterprise data.

Settings	Descriptions
Show EDP Icons	Enable to display an EDP icon() in the Web browser, file explorer, and app icons when accessing protected data. The icon also displays in enterprise-only app tiles on the Start menu.
Revoke on Unenroll	Enable to revoke Data Protection keys from a device when the device unenrolls from AirWatch.
Protection Under Lock	Enable to cryptographically protect enterprise data while the device is locked.
User Decryption	Enable to allow users to select how data is saved using an enlightened app. They can select Save as Corporate or Save as Personal . If this option is not enabled, all data saved using an enlightened app will save as corporate data and encrypt using the corporate encryption.
Direct Memory Access	Enable to allow users direct access to device memory.
Data Recovery Certificate	Upload the special Encrypting File System certificate to use for file recovery if your encryption key is lost or damaged. For more information, see Create an Encrypting File System Certificate (Windows Phone) .

- 7 Select **Save & Publish** to push the profile to devices.

Create an Encrypting File System Certificate (Windows Phone)

The Data Protection profile encrypts enterprise data and restricts access to approved devices. Create an EFS certificate to encrypt your enterprise data protected by a Data Protection profile.

Procedure

- 1 On a computer without an EFS certificate, open a command prompt (with admin rights) and navigate to the certificate store you where you want to store the certificate.
- 2 Run the command:
`cipher /r:<EFSRA>`
The value of <EFSRA> is the name of the .cer and .pfx files that you want to create.
- 3 When prompted, enter the password to help protect your new .pfx file.
- 4 The .cer and .pfx files are created in the certificate store you selected.
- 5 Upload your .cer certificate to devices as part of a Data Protection profile. For more information, see [Configure a Data Protection Profile \(Windows Phone\)](#).

Create Custom Settings Profile (Windows Phone)

The **Custom Settings** payload provides a way to use Windows Phone functionality that AirWatch does not currently support through its native payloads. If you want to use the new features, you can use the **Custom Settings** payload and XML code to manually enable or disable certain settings.

Procedure

- 1 Navigate to **Devices > Profiles > List View > Add** and select **Add Profile**.

- 2 Select **Windows** and then select **Windows Phone**.

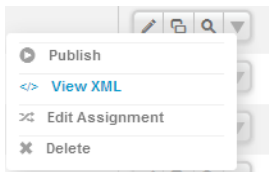

- 3 Configure the profile's **General** settings.

- 4 Configure the applicable payload (for example, Restrictions or Passcode).

You can work on a copy of your profile, saved under a "test" organization group, to avoid affecting other users before you are ready to Save and Publish.

- 5 **Save**, but do not publish, your profile.

- 6 Select **View XML** from the actions menu in the **Profiles List View** for the row of the profile you want to customize.

- 7 Find the section of text starting with `<characteristic>` ... `<characteristic>` that you configured previously, for example, Restrictions or Passcode. The section contains a configuration type identifying its purpose, for example, restrictions.

- 8 Copy this section of text and close the XML View. Open your profile.

- 9 Select the **Custom Settings** payload and select **Configure**. Paste the XML you copied in the text box. The XML code you paste should contain the complete block of code, from `<characteristic>` to `<characteristic>`.

- 10 Remove the original payload you configured by selecting the base payload section and selecting the minus [-] button. You can now enhance the profile by adding custom XML code for the new functionality.

Any device not upgraded to the latest version ignores the enhancements you create. Since the code is now custom, you should test the profile devices with older versions to verify expected behavior.

- 11 Select **Save & Publish**.

Compliance Policies

The compliance engine is an automated tool by Workspace ONE UEM that ensures all devices abide by your policies. These policies can include basic security settings such as requiring a passcode and having a minimum device lock period.

For certain platforms, you can also decide to set and enforce certain precautions. These precautions include setting password strength, blacklisting certain apps, and requiring device check-in intervals to ensure that devices are safe and in-contact with Workspace ONE UEM. Once devices are determined to be out of compliance, the compliance engine warns users to address compliance errors to prevent disciplinary action on the device. For example, the compliance engine can trigger a message to notify the user that their device is out of compliance.

In addition, devices not in compliance cannot have device profiles assigned to it and cannot have apps installed on the device. If corrections are not made in the amount of time specified, the device loses access to certain content and functions that you define. The available compliance policies and actions vary by platform.

For more information about compliance policies, including which policies and actions are supported for a particular platform, see the **Managing Devices** documentation on docs.vmware.com.

This chapter includes the following topics:

- [Configure Health Attestation for Windows Phone Compliance Policies](#)

Configure Health Attestation for Windows Phone Compliance Policies

Keep your devices secured by using Windows Health Attestation Service for compromised device detection. This service allows AirWatch to check the device integrity during boot and take corrective actions.

Compromised status compliance policy is applicable to Windows 10 Mobile devices with a Trusted Platform Module (TPM) 1.2 or higher.

Procedure

- 1 Navigate to **Groups & Settings > All Settings > Devices & Users > Windows > Windows Phone > Windows Health Attestation**.
- 2 (Optional) Select **Use Custom Server** if you are using a custom on-premises server running Health Attestation. Enter the **Server URL**.

3 Configure the Health Attestation settings:

Settings	Descriptions
Compromised Status Definition	
Use Custom Server	Select to configure a custom server for Health Attestation. This option requires a server running Windows Server 2016 or newer. Enabling this option displays the Server URL field.
Server URL	Enter the URL for your custom Health Attestation server.
Secure Boot Disabled	Enable to flag compromised device status when Secure Boot is disabled on the device. Secure Boot forces the system to boot to a factory trusted state. When Secure Boot is enabled, the core components used to boot the machine must have the correct cryptographic signatures that the OEM trusts. The UEFI firmware verifies the trust before it allows the machine to start. Secure boot prevents the startup if any it detects any tampered files.
Attestation Identity Key (AIK) Not Present	Enable to flag compromised device status when the AIK is not present on the device. Attestation Identity Key (AIK) is present on a device, it indicates that the device has an endorsement key (EK) certificate. It can be trusted more than a device that does not have an EK certificate.
Data Execution Prevention (DEP) Policy Disabled	Enable to flag compromised device status when the DEP is disabled on the device. The Data Execution Prevention (DEP) Policy is a memory protection feature built into the system level of the OS. The policy prevents running code from data pages such as the default heap, stacks, and memory pools. DEP is enforced by both hardware and software.
BitLocker Disabled	Enable to flag compromised device status when BitLocker encryption is disabled on the device.
Code Integrity Check Disabled	Enable to flag compromised device status when the code integrity check is disabled on the device. Code integrity is a feature that validates the integrity of a driver or system file each time it is loaded into memory. Code integrity checks for unsigned drivers or system files before they load into the kernel. The check also scans for users with administrative privileges running system files modified by malicious software.
Early Launch Anti-Malware Disabled	Enable to flag compromised device status when the early launch anti-malware is disabled on the device. Early launch anti-malware (ELAM) provides protection for the computers in your network when they start up and before third-party drivers initialize.
Code Integrity Version Check	Enable to flag compromised device status when the code integrity version check fails.
Boot Manager Version Check	Enable to flag compromised device status when the boot manager version check fails.
Boot App Security Version Number Check	Enable to flag compromised device status when the boot app security version number does not meet the entered number.
Boot Manager Security Version Number Check	Enable to flag compromised device status when the boot manager security version number does not meet the entered number.
Advanced Settings	Enable to configure advance settings in the Software Version Identifiers section.
Software Version Identifiers	
Code Integrity Policy Hash Check	Enable to define a whitelist of known, valid hash values for the Code Integrity software. If the hash is not a whitelisted value, health attestation compliance fails.

Settings	Descriptions
Secure Boot Config Policy Hash Check	Enable to define a whitelist of known, valid hash values for the Secure Boot Config software. If the hash is not a whitelisted value, health attestation compliance fails.
PCR0 Check	Enable to define a whitelist of known, valid measurements for the PCR0 Check software. This measurement checks the BIOS trusted code to ensure that it has not been compromised. If the measurement is not a whitelisted value, health attestation compliance fails.

What to do next

For more information, see the Microsoft TechNet article on Health Attestation.

AirWatch Applications for Windows Phone

5

You can use AirWatch applications in addition to AirWatch MDM features to further secure devices and configure them with added functionality.

Use the VMware Content Locker to safeguard corporate content on mobile devices and deploy the VMware Browser to enable secure Web browsing for your end users. Download the Workspace ONE Intelligent Hub for Windows to monitor your devices on a more granular level.

For more information about deploying public, internal, and purchased applications, including an App Catalog, see the comprehensive **AirWatch Mobile Application Management Guide**.

This chapter includes the following topics:

- [Configure the Workspace ONE Intelligent Hub \(Windows Phone\)](#)
- [Application-Level Single Sign On Passcodes](#)
- [VMware Content Locker for Windows Phone](#)
- [VMware Browser for Windows Phone](#)

Configure the Workspace ONE Intelligent Hub (Windows Phone)

The Workspace ONE Intelligent Hub for Windows Phone devices is pre-configured with AirWatch. Change these settings when you need the Workspace ONE Intelligent Hub to meet certain business needs.

Procedure

- 1 In the AirWatch Console, select the applicable **Organization Group** to apply settings to.
- 2 Navigate to **Groups & Settings > All Settings > Device & Users > Windows > Windows Phone > Hub Settings**.
- 3 Enable the following options in the **Hub Settings** section:

Setting	Description
Heartbeat Interval (min)	Set the time (in minutes) the Workspace ONE Intelligent Hub waits before checking in with the UEM console.
Data Sample Interval (min)	Set the time (in minutes) the Workspace ONE Intelligent Hub waits to collect data from the device.

Setting	Description
Profile Refresh Interval (min)	Set the frequency (in minutes) the profile list of each device refreshes on the server.
Enable Passcode	Enable the use of a passcode to access the Workspace ONE Intelligent Hub settings on the device.
Administrative Passcode	Enter the administrative passcode to enter for access to Hub settings on the device.
Collect Location Data	Enable to collect the location data from the device. The location is determined based on the Wi-Fi network of the device. When located data is available, the Workspace ONE Intelligent Hub sends the location data to the console at the Transmit Interval.
GPS Sample Interval (min)	Set the time (in minutes) the Workspace ONE Intelligent Hub waits before collecting GPS data from the device.
Enable Push Notification Services	Enable to allow the console to send Push Notifications to devices.

Application-Level Single Sign On Passcodes

Single sign on (SSO) allows end users to access Workspace ONE UEM apps, wrapped apps, and SDK-enabled apps without entering credentials for each application. Using the Workspace ONE Intelligent Hub or the AirWatch Container as a "broker application," end users authenticate once per session using their normal credentials or an SSO Passcode.

Enable SSO as part of the **Security Policies** that you configure to apply to all Workspace ONE UEM apps, wrapped apps, and SDK-enabled apps using a Default SDK Profile.

Procedure

- 1 Navigate to **Groups & Settings > All Settings > Apps > Settings and Policies > Security Policies**.
- 2 Set **Single Sign On** to **Enabled** to allow end users to access all Workspace ONE UEM applications and maintain a persistent login.
- 3 Optionally set **Authentication Type** to **Passcode** and set the **Passcode Mode** to either **Numeric** or **Alphanumeric** to require an SSO Passcode on the device. If you enable SSO but do not enable an Authentication Type, end users use their normal credentials (either directory service or Workspace ONE UEM account) to authenticate, and an SSO Passcode does not exist.

Once an end user authenticates with an application participating in SSO, a session establishes. The session is active until the **Authentication Timeout** defined in the SDK profile is reached.

VMware Content Locker for Windows Phone

VMware Content Locker is an application that enables your end users to access important content on their devices while ensuring file safety for your organization.

From the VMware Content Locker, end users can access content you upload in the UEM console, content from synced corporate repositories, or their own personal content.

Use the UEM console to add content, sync repositories and configure the actions that end users can take on content opened within the application. These configurations prevent content from being copied, shared, or saved without approval.

VMware Browser for Windows Phone

VMware Browser is an application that provides a manageable and secure alternative to native Web browsers. You can secure the browsing experience on an application, tunnel, and Web site level.

You can configure the VMware Browser to meet unique business needs by restricting Web access to Web sites and providing a secure Internet portal for mobile point-of-sale devices. Provide users with a standard browsing experience, including support of multi-tabbed browsing and JavaScript dialog box.

For additional information about preparing and configuring the VMware Browser for deployment, refer to the **VMware AirWatch Browser Guide**.

Windows Phone Device Management Overview

6

After your devices are enrolled and configured, manage the devices using the Workspace ONE™ UEM console. The management tools and functions enable you to keep an eye on your devices and remotely perform administrative functions.

You can manage all your devices from the UEM console. The Dashboard is a searchable, customizable view that you can use to filter and find specific devices. This feature makes it easier to perform administrative functions on a particular set of devices. The Device List View displays all the devices currently enrolled in your Workspace ONE UEM environment and their status. The **Device Details** page provides device-specific information such as profiles, apps, Workspace ONE Intelligent Hub version and which version of any applicable OEM service currently installed on the device. You can also perform remote actions on the device from the Device Details page that are platform-specific.

This chapter includes the following topics:

- [Device Dashboard](#)
- [Device List View](#)
- [Windows Phone Device Details](#)

Device Dashboard

As devices are enrolled, you can manage them from the Workspace ONE UEM powered by AirWatch **Device Dashboard**.

The **Device Dashboard** provides a high-level view of your entire fleet and allows you to act on individual devices quickly.

You can view graphical representations of relevant device information for your fleet, such as device ownership type, compliance statistics, and platform and OS breakdowns. You can access each set of devices in the presented categories by selecting any of the available data views from the **Device Dashboard**.

From the **List View**, you can take administrative action: send messages, lock devices, delete devices, and change groups associated with the device.

- **Security** – View the top causes of security issues in your device fleet. Selecting any of the doughnut charts displays a filtered **Device List** view comprised of devices affected by the selected security issue. If supported by the platform, you can configure a compliance policy to act on these devices.
 - **Compromised** – The number and percentage of compromised devices (jailbroken or rooted) in your deployment.
 - **No Passcode** – The number and percentage of devices without a passcode configured for security.
 - **No Encryption** – The number and percentage of devices that are not encrypted for security. This reported figure excludes Android SD Card encryption. Only those Android devices lacking disc encryption are reported in the donut graph.
- Ownership** – View the total number of devices in each ownership category. Selecting any of the bar graph segments displays a filtered **Device List** view comprised of devices affected by the selected ownership type.
- **Last Seen Overview/Breakdown** – View the number and percentage of devices that have recently communicated with the Workspace ONE UEM MDM server. For example, if several devices have not been seen in over 30 days, select the corresponding bar graph to display only those devices. You can then select all these filtered devices and send them a message requesting that they check in.
- **Platforms** – View the total number of devices in each device platform category. Selecting any of the graphs displays a filtered **Device List** view comprised of devices under the selected platform.
- **Enrollment** – View the total number of devices in each enrollment category. Selecting any of the graphs displays a filtered **Device List** view comprised of devices with the selected enrollment status.
- **Operating System Breakdown** – View devices in your fleet based on operating system. There are separate charts for Apple iOS, Android, Windows Phone, and Windows Rugged. Selecting any of the graphs displays a filtered **Device List** view comprised of devices running the selected OS version.

Device List View

Use the Device List View in Workspace ONE UEM powered by AirWatch to see a full listing of all devices in the currently selected organization group.

The **Last Seen** column displays an indicator showing the number of minutes elapsed since the device has checked-in. The indicator is red or green, depending on the number of minutes defined in **Device Inactivity Timeout (min)**. This indicator can be set by navigating to **Groups & Settings > All Settings > Devices & Users > General > Advanced**.

Select a device friendly name in the **General Info** column at any time to open the details page for that device. A **Friendly Name** is the label you assign to a device to help you differentiate it from other devices, particularly other devices of the same make and model.

Sort by columns and configure information filters to review device activity based on specific information. For example, sort by the **Compliance Status** column to view only devices that are currently out-of-compliance and target only those devices. Search all devices for a friendly name or user name to isolate one device or user.

Customize Device List View Layout

Display the full listing of visible columns in the **Device List** view by selecting the **Layout** button and select the **Custom** option. This view enables you to display or hide Device List columns per your preferences.

There is also an option to apply your customized column view to all administrators. For instance, you can hide 'Asset Number' from the **Device List** views of the current OG and of all the OGs underneath.

Once all your customizations are complete, select the **Accept** button to save your column preferences and apply this new column view. You can return to the **Layout** button settings at any time to tweak your column display preferences.

Search in Device List View

You can search for a single device for quick access to its information and take remote action on the device.

To run a search, navigate to **Devices > List View**, select the **Search List** bar and enter a user name, device friendly name, or other device-identifying element. This action initiates a search across all devices, using your search parameter, within the current organization group and all child groups.

Windows Phone Device Details

Use the Device Details page to track detailed device information and quickly access user and device management actions.

You can access Device Details by selecting a device Friendly Name from the Device List View, using one of the Dashboards, or with any of the search tools.

From the Device Details page, you can access specific device information broken into different menu tabs. Each menu tab contains related device information depending on your AirWatch deployment.

Remote Actions

The **More drop-down** on the Device Details page enables you to perform remote actions over the air to the selected device.

The actions vary depending on factors such as the device platform, AirWatch Console settings, and enrollment status:

- **Add Tag** – Assign a customizable tag to a device, which can be used to identify a special device in your fleet.
- **Change Device Passcode** – Replace any existing device passcode used to access the selected device with a new passcode.
- **Change Organization Group** – Change the device's home organization group to another pre-existing OG. Includes an option to select a static or dynamic OG.
- **Delete Device** – Delete and unenroll a device from the console. Sends the enterprise wipe command to the device that gets wiped on the next check-in and marks the device as **Delete In Progress** on the console. If the wipe protection is turned off on the device, the issued command immediately performs an enterprise wipe and removes the device representation in the console.
- **Device Information (Query)** – Send an MDM query command to the device to return basic information on the device such as friendly name, platform, model, organization group, operating system version and ownership status.
- **Device Wipe** – Send an MDM command to wipe a device clear of all data and operating system. This puts the device in a state where recovery partition will be needed to reinstall the OS. This action cannot be undone.
 - iOS Device Wipe Considerations
 - For iOS 11 and below devices, the device wipe command would also wipe the Apple SIM data associated with the devices.
 - For iOS 11+ devices, you have the option to preserve the Apple SIM data plan (if existed on the devices). To do this, select the **Preserve Data Plan** checkbox on the Device Wipe page before sending the device wipe command.
 - For iOS 11.3+ devices, you have an additional option to enable or disable to skip the **Proximity Setup** screen while sending down the device wipe command. When the option is enabled, the Proximity Setup screen will be skipped in the Setup Assistant and thus preventing the device user from seeing the Proximity Setup option.
 - For Windows Desktop Devices, you can choose the type of device wipe.
 - **Wipe** - This option wipes the device of all content.
 - **Wipe Protected** - This option is similar a normal device wipe, but this option cannot be circumvented by the user. The Wipe Protected command keeps trying to reset the device until it is successful. In some device configurations, this command can leave the device unable to boot.

- **Wipe and Persist Provisioning Data** - This option wipes the device but specifies that provisioning data should be backed up to a persistent location. After the wipe executes, the provisioning data is restored and applied to the device. The provisioning folder is saved. You can find the folder by navigating on the device to %ProgramData%\Microsoft\Provisioning .
- **Edit Device** – Edit device information such as **Friendly Name**, **Asset Number**, **Device Ownership**, **Device Group** and **Device Category**.
- **Enterprise Wipe** – Enterprise Wipe a device to unenroll and remove all managed enterprise resources including applications and profiles. This action cannot be undone and re-enrollment will be required for Workspace ONE UEM to manage this device again. Includes options to prevent future re-enrollment and a **Note Description** field for you to add any noteworthy details about the action.
 - Enterprise Wipe is not supported for cloud domain-joined devices.
- **Find Device** – Send a text message to the applicable Workspace ONE UEM application together with an audible sound (with options to repeat the sound a configurable number of times and the length of the gap, in seconds, between sounds). This audible sound should help the user locate a misplaced device.
- **Lock Device** – Send an MDM command to lock a selected device, rendering it unusable until it is unlocked.
- **Rename Device** – Change the device friendly name within the UEM console.
- **Device Information (Query)** – Send an MDM query command to the device to return basic information on the device such as friendly name, platform, model, organization group, operating system version and ownership status.
- **Send Message** – Send a message to the user of the selected device. Choose between **Email**, **Push Notification** (through AirWatch Cloud Messaging), and **SMS**.
