Sizing Infrastructure for NFS Repository Sync

1

Workspace ONE UEM powered by AirWatch provides VMware Content Gateway, a secure and effective medium through which network share repositories like NetApp, SMB, and Network File Share (NFS) provide content access for end users. The performance of the Content Gateway depends on the number of users syncing and accessing the content.

To help you provide the best experience to your end user, we have tested the NFS repository sync performance at Workspace ONE UEM by configuring NFS with Content Gateway on Unified Access Gateway.

This documentation helps you to estimate the load Content Gateway can handle with the available resources and helps you to provide seamless access to the end-user documents.

This chapter includes the following topics:

- [NFS Testing Requirements](#)
- [Sync Recommendations](#)

NFS Testing Requirements

The infrastructure that we have used for testing the NFS repository with Content Gateway configured on the Unified Access Gateway appliance is listed in this section. The requirements and details specified in this section can be used for reference purpose. The requirements can change as per your need and supporting infrastructure.

High-Level Infrastructure

- A single instance of Content Gateway on Unified Access Gateway configured in the cascade mode on VMware vSphere, with a Windows share configured on the same domain.
- No load balancers are used.

Hardware Specifications

Table 1-1. Content Gateway

CPU Core	RAM	Disk Space	Notes
2	4 GB	20 GB	The requirements provided in the table are for supporting a basic data query. Large-scale UEM deployment has 4 cores of CPU and 16 GB of RAM to provide higher performance.

Table 1-2. Windows NFS

CPU Core	RAM	Disk Space	Notes
16	4 GB	100 GB	The requirements provided in the table are used for conducting performance tests on NFS. The results can vary with varying specifications.

Sync Recommendations

The following data is derived from the NFS repository sync performance tested using Workspace ONE UEM. The sync test results can vary if the NFS or Content Gateway specifications are changed. Use the results as reference when using Content Gateway with the NFS repository.

Consider the number of sync requests as device requests with the assumption that each device makes one request.

Number of Files in NFS Repository	Number of Sync Requests	
	In 5 Minutes	In 1 Hour
500	7000–8000	85000–87000
1000	5000–6000	55000–60000
5000	2000–3000	20000–23000
