About This Programming Guide

1

The vRealize Operations Cloud API Programming Guide provides information about the vRealize Operations Cloud REST APIs, including how to use the REST API resources, authenticate, and construct REST API calls.

Intended Audience

This information is intended for administrators and programmers who want to configure and manage vRealize Operations Cloud programmatically using the vRealize Operations Cloud REST API. The guide focuses on common use cases.

Understanding the vRealize Operations Cloud API

2

Developers can use the API to build interactive clients of vRealize Operations Cloud. The API follows the REST style and is available to all licensed users.

vRealize Operations Cloud clients communicate with the server over HTTP, exchanging representations of vRealize Operations Cloud objects. These representations take the form of JSON or XML elements. You use HTTP GET requests to retrieve the current representation of an object, HTTP POST and PUT requests to create or modify an object, and HTTP DELETE requests to delete an object.

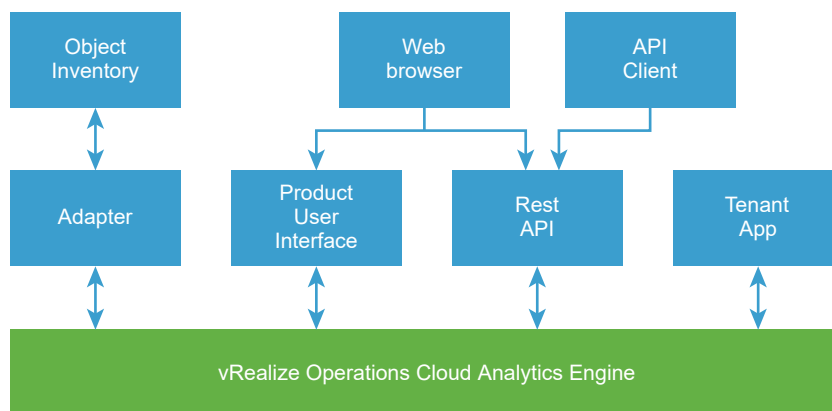

This chapter includes the following topics:

- [How the vRealize Operations Cloud API Works](#)
- [Client Workflow Overview](#)
- [Using the API with vRealize Operations Cloud](#)

How the vRealize Operations Cloud API Works

You use a Web browser to communicate with the vRealize Operations Cloud analytics engine, either through the product user interface or through API calls.

Figure 2-1. vRealize Operations Cloud Simplified Architecture

The adapter instance collects data from objects in your monitored environment. The vRealize Operations Cloud analytics engine processes the data and displays the complete model in the graphical interface.

Why Use the API

The API is most useful when there is a need to automate a well-defined workflow, such as repeating the same tasks to configure access control for new vRealize Operations Cloud users. The API is also useful when performing queries on the vRealize Operations Cloud data repository, such as retrieving data for particular assets in your virtual environment. In addition, you can use the API to extract all data from the vRealize Operations Cloud data repository and load it into a separate analytics system.

vRealize Operations Cloud Terminology

The XML syntax you use to describe the objects for an adapter corresponds to the API code syntax but differs from what you find in the user interface. The following terms appear in the user interface. Included with the description of each term is the corresponding XML syntax used in an API call.

Adapter types Defines the adapter used to discover particular object types. For example, the vCenter adapter discovers objects connected to vSphere datacenters. The AWS adapter discovers AWS services and objects.

XML syntax: `adapterkinds`.

Object types The class of entities that represent objects or information sources. Objects report data to the vRealize Operations Cloud analytics engine. Virtual machines, datastores, and host systems are examples of object types defined in a vCenter adapter model.

XML syntax: `resourcekinds`.

Client Workflow Overview

vRealize Operations Cloud API clients implement a REST workflow, making HTTP requests to the server and retrieving the information they need from the server's responses.

About REST

REST, an acronym for Representational State Transfer, describes an architectural style characteristic of programs that use the Hypertext Transfer Protocol (HTTP) to exchange serialized representations of objects between a client and a server. In the vRealize Operations Cloud API, these representations are JSON or XML documents.

In a REST workflow, representations of objects are passed back and forth between a client and a server with the explicit assumption that neither party need know anything about an object other than what is presented in a single request or response. The URLs at which these documents are available often persist beyond the lifetime of the request or response that includes them.

REST API Workflows

Application programs written to use a REST API use HTTP requests that are often executed by a script or other higher-level language to make remote procedure calls that create, retrieve, update, or delete objects that the API defines. In the vRealize Operations Cloud REST API, these objects are defined by a collection of XML schemas. The operations themselves are HTTP requests, and so are generic to all HTTP clients.

To write a REST API client application, you must understand only the HTTP protocol, and the semantics of JSON or XML, the transfer format that the vRealize Operations Cloud API uses. To use the API effectively in such a client, you must become familiar with the following concepts.

- The set of objects that the API supports, and what they represent.
- How the API represents these objects.
- How a client refers to an object on which it wants to operate.

The API reference includes a complete list of API requests. See [About the Schema Reference](#).

vRealize Operations Cloud API REST Requests

To retrieve object representations, clients make HTTP requests to object references.

Security

The HTTP link between an API client and server is established using SSL. API clients configure token-based authentication to communicate with the server.

Figure 2-2. Scenario: Provide user credentials to obtain details about alert with ID 123

You can call the vRealize Operations Cloud APIs after generating the Cloud Services authentication token. Use the following endpoint:

```
https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api
```

Note If your organization is located outside of the United States, use the country abbreviation for your API endpoint. Using the wrong endpoint will result in a 404 error. For example, if your organization is located in Australia, your country abbreviation is AU and your API endpoint is:

```
https://au.www.mgmt.cloud.vmware.com/vrops-cloud/suite-api
```

You must pass the Cloud Services authentication token with every request as an HTTP header in the following format:

```
Authorization: CSPToken {CSP Auth Token}
```

For example:

```
curl -k https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/resources -H "Content-Type: application/json" -H "Accept: application/json" -H "Authorization: CSPToken abc12345..."
```

Request Headers

The following HTTP headers are typically included in API requests:

Accept-Language To specify the language desired in responses, use the `Accept-Language` request header. Message strings in `ErrorType` responses are localized. To request a response with message strings localized to French, use the following header:

```
Accept-Language: fr-FR
```

Authorization All requests to create an API session must include an `Authorization` header of the form prescribed by the identity provider that your organization uses

Content-Type Requests that include a body must include an appropriate HTTP `Content-Type` header.

- For a request body in XML, the header must include `Content-Type: application/xml`
- For a request body in JSON, the header must include `Content-Type: application/json`

Accept To specify the desired response format, include the `Accept` request header.

- For a response in XML, the header must include `Accept: application/xml`
- For a response in JSON, the header must include `Accept: application/json`

Request Bodies in XML

For a request body written in XML, vRealize Operations Cloud uses a validating XML parser that requires elements in a request body to agree with the schema in order and number. Request bodies are rejected as invalid unless they meet the following criteria:

- XML namespace attributes must be supplied for all namespaces represented by elements in the request.
- If multiple namespaces are represented in the request, XML namespace attributes must include an identifying prefix, and that prefix must be used with all elements from that namespace.
- All required elements must appear in request bodies. All elements that appear in request bodies must appear in the order that the schema establishes, and with content that conforms to the type constraint that the schema specifies.

vRealize Operations Cloud API REST Responses

All responses include an HTTP status code and, unless the status code is 204 (No Content), an `Accept` header. Response content depends on the request. Some responses include a document body, some include only a URL, and some are empty.

HTTP Response Codes

An API client can expect a subset of HTTP status codes in a response.

Table 2-1. HTTP Status Codes that the API Returns

Status Code	Status Description
200 OK	The request is valid and was completed. The response includes a document body.
201 Created	The request is valid. The requested object was created and can be found at the URL specified in the Location header.
202 Accepted	The request is valid and a task was created to handle it. This response is usually accompanied by a TaskStatus element .
204 No Content	The request is valid and was completed. The response does not include a body.
400 Bad Request	The request body is malformed, incomplete, or otherwise invalid.
401 Unauthorized	Login failed or authentication token has expired.
403 Forbidden	The user is not authenticated or does not have adequate privileges to access one or more objects specified in the request.
404 Not Found	The object specified in the request could not be found.
405 Method Not Allowed	The HTTP method specified in the request is not supported for this object.
406 Not Acceptable	The resource identified by the request is not capable of generating a response of the type specified in the request's Accept header.
415 Unsupported Media Type	The resource identified by the request does not support a request of the specified Content-Type and HTTP method.
422 Not Found	Usually indicates a malformed request URL or request body.
429 Too Many Requests	A client has sent too many requests or multiple clients are sending too many simultaneous requests and the server is unable to process them due to rate limits. To work around the problem, try sending the request again later.
500 Internal Server Error	The request was received but could not be completed because of an internal error on the server.
503 Service Unavailable	The server is currently unable to handle the request due to a temporary condition such as resource exhaustion or server maintenance.
504 Gateway Timeout	The server, while acting as a gateway or proxy, did not receive a timely response from the upstream server specified by the request URL.

Using the API with vRealize Operations Cloud

You can use a browser or an HTTP client program to send requests and receive responses.

REST Client Programs

Any client application that can send HTTPS requests is an appropriate tool for developing REST applications with the vRealize Operations Cloud API. REST client plug-ins are available for most browsers and many IDEs. The following open-source programs are commonly used:

- cURL. <http://curl.haxx.se>
- Postman application. <http://www.getpostman.com>

In addition, VMware provides language-specific client bindings for the vRealize Operations Cloud API. See [About the Schema Reference](#).

About the Schema Reference

The vRealize Operations Cloud REST API documentation includes reference material for all elements, types, queries, and operations in the vRealize Operations Cloud API. It also includes the schema definition files.

Swagger based API documentation is available with the product, with the capability of making REST API calls right from the landing page.

To access the API documentation, use the URL of your vRealize Operations Cloud instance. For example, if the URL of your instance is `https://www.mgmt.cloud.vmware.com`, the API reference is available from: <https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/doc/swagger-ui.html>.

Note If your organization is located outside of the United States, use the country abbreviation for your API endpoint. Using the wrong endpoint will result in a 404 error. For example, if your organization is located in Australia, your country abbreviation is AU and your API documentation will be available at:

```
https://au.www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/doc/swagger-ui.html
```

Language-specific client bindings are available from:

```
https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/
```

About the vRealize Operations Cloud API Examples

All examples include HTTP requests and responses. These examples show the workflow and content associated with operations such as creating and querying for information about objects in your monitored environment.

Example request bodies are in JSON. Request headers required by the vRealize Operations Cloud API are included in example requests that are not fragments of a larger example.

Most example responses show only those elements and attributes that are relevant to the operation being discussed. Ellipses (...) indicate omitted content within response bodies.

Getting Started with the API

3

API clients and vRealize Operations Cloud servers communicate over HTTPS, exchanging XML representations of API objects.

This simple example of a REST API workflow shows how to obtain a list of all metrics for a virtual machine object type that is included in the model definition of the VMware vCenter® adapter. Using the API, you can obtain the complete list of available metrics for any object type.

This chapter includes the following topics:

- [Generate Cloud Services Authentication Tokens](#)
- [Find the Adapter Type and Object Type](#)
- [Generate a List of All Metrics for the Object](#)

Generate Cloud Services Authentication Tokens

Developers can use the API to build interactive clients of vRealize Operations Cloud. The API follows the REST style and is available to all licensed users.

Procedure

- 1 Generate the API tokens from the Cloud Services toolbar to authenticate yourself when you make authorized API connections. See, [Generate API Tokens](#).
- 2 Call the Cloud Services API using the API token to generate the Cloud Services authentication token.

```
curl -k -X POST "https://console.cloud.vmware.com/csp/gateway/am/api/auth/api-tokens/authorize" -H "accept: application/json" -H "Content-Type: application/x-www-form-urlencoded" -d "refresh_token={CSP API Token}"
```

This returns a JSON string with the following structure in which `access_token` is the Cloud Services authentication token:

```
{
  "id_token",
  "token_type",
  "expires_in",
```

```

    "scope",
    "access_token",
    "refresh_token"
  }

```

Note The Cloud Services authentication token is valid only for 30 minutes after it is generated.

Find the Adapter Type and Object Type

Your vRealize Operations Cloud instance includes multiple adapter types. To find the adapter type for the vCenter adapter, you make a GET request to retrieve a list of all adapter types. The API response includes all the object types that the adapter monitors.

Prerequisites

Verify that you are logged in to the vRealize Operations Cloud instance.

Procedure

- 1 Make a GET request for all adapter types.

```
GET https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/adapterkinds
```

- 2 Examine the response to find the vCenter adapter and list of monitored object types.

See the response portion of [Determine the Adapter Type and Object Types for the vCenter Adapter](#).

Example: Determine the Adapter Type and Object Types for the vCenter Adapter

This example finds the adapter type for the vCenter adapter and all the object types included in the adapter model definition.

Request header:

```

GET https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/adapterkinds
Content-Type: application/json
Authorization: CSPToken <csp auth token>
Accept: application/json

```

Where *<csp auth token>* is the token that you obtained from the response in [Generate Cloud Services Authentication Tokens](#).

Snippet of the response in JSON for the vCenter Adapter:

```
200 OK
```

```

{
  "key": "VMWARE",
  "name": "vCenter Adapter",
  "description": "Provides the connection information and credentials required...",
  "adapterKindType": "GENERAL",
  "describeVersion": 573,

```

```

"identifiers": [],
"resourceKinds": [
  "ClusterComputeResource",
  "ComputeResource",
  "CustomDatacenter",
  "Datacenter",
  "Datastore",
  "StoragePod",
  "DatastoreFolder",
  "VM Entity Status",
  "Folder",
  "HostFolder",
  "HostSystem",
  "NetworkFolder",
  "ResourcePool",
  "VMwareAdapter Instance",
  "VirtualMachine",
  "VMFolder",
  "DistributedVirtualPortgroup",
  "VmwareDistributedVirtualSwitch",
  "vSphere World"
],
...
}

```

For the vCenter adapter, the `adapter-kind` key is `VMWARE`. The `resourceKinds` are the object types that the vCenter adapter monitors. For virtual machine object type, the `resourceKinds` is `VirtualMachine`.

Generate a List of All Metrics for the Object

To generate a complete list of metrics for any virtual machine defined in the vCenter adapter model, you make a GET request to the URL with the adapter type and the object type.

Prerequisites

Verify that the following requirements are met:

- You are logged in to the vRealize Operations Cloud instance.
- You know the `adapterKind` value for the vCenter adapter and the `resourceKinds` value for the virtual machine. See [Determine the Adapter Type and Object Types for the vCenter Adapter](#)

Procedure

- 1 Make a GET request to obtain the metadata for metrics.

```
GET https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/adapterkinds/VMWARE/resourcekinds/VirtualMachine/statkeys
```

- 2 Compare the metrics listed in the response to metrics displayed in the user interface. See [Virtual Machine Metrics from the API and in the User Interface](#)

Example: Virtual Machine Metrics from the API and in the User Interface

This example shows how the virtual machine metrics listed in the XML response compare to the metrics displayed in the vRealize Operations Cloud user interface.

Request:

```
GET https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/adapterkinds/VMWARE/resourcekinds/
VirtualMachine/statkeys
Content-Type: application/json
Authorization: CSPToken <csp_auth_token>
Accept: application/json
```

Where:

- VMWARE is the adapterKindKey.
- VirtualMachine is the resourceKindKey.
- *csp_auth_token* is the token that you obtained from the response in [Generate Cloud Services Authentication Tokens](#).

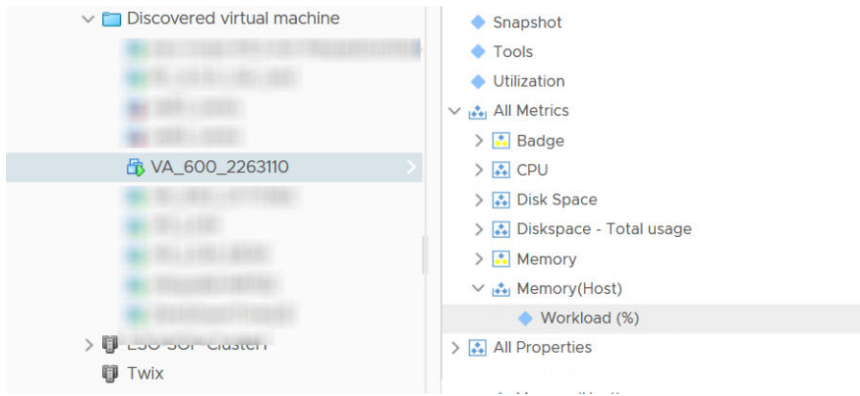

Snippet of the response in JSON:

```
200 OK
```

```
{
  "resourceTypeAttributes": [
    ...
    {
      "key": "mem|host_workload",
      "name": "Memory|Host Workload",
      "description": "Host Workload (%)",
      "defaultMonitored": false,
      "rollupType": "AVG",
      "instanceType": "INSTANCED",
      "unit": "%",
      "dataType2": "FLOAT",
      "monitoring": false,
      "property": false
    },
    ...
  ]
}
```

Every `resourceTypeAttribute` in the response is a metric with metadata for a virtual machine object. The name corresponds to text displayed in the vRealize Operations Cloud user interface. In this example, the snippet lists metrics for Memory and Host Workload.

To compare metrics in the response with metrics in the user interface, log in to the vRealize Operations Cloud instance running on `mgmt.cloud.vmware.com` and navigate to the metrics for a virtual machine. The following example shows where you find metrics for Memory(Host) and Workload.

The example shows how to retrieve metrics for the virtual machine object type. To retrieve metrics for other object types, replace `VirtualMachine` in the GET request with other resourceKinds.

Configuring an Adapter Instance

4

After installing a solution that includes a management pack with an adapter, you must configure an adapter instance to collect data from the objects in the adapter model definition. You can use the vRealize Operations Cloud API to configure an adapter instance.

This use case example shows how to configure an adapter instance for a vSphere Solution and includes:

- summary of operations with request, request body, and response for each
- specific procedure for each operation

This chapter includes the following topics:

- [Summary of Configuring an Adapter Instance Requests](#)
- [Identify the Solution and Its Adapters](#)
- [Identify the Object Types Required for the Adapter](#)
- [Create the Adapter Instance](#)
- [Provide Proof of Certificate Validity](#)
- [Start Monitoring the New Adapter Instance](#)

Summary of Configuring an Adapter Instance Requests

You make sequential API requests to configure an adapter instance. Responses from earlier requests yield information required for a subsequent requests.

Table 4-1. Summary of Requests

Operation	Request	Request Body	Response
Get all solutions registered with the product and identify the adapter types	GET <API-URL>/suite-api/api/solutions	None	adapterkindkeys
Get all the object types for a particular adapter type.	GET <API-URL>/suite-api/api/adapterkinds/{key}/resourcekinds	None	resourceIdentifierTypes

Table 4-1. Summary of Requests (continued)

Operation	Request	Request Body	Response
Create an adapter instance object	POST <API-URL>/suite-api/api/adapters	Values for resourceIdentifiers and credential	adapterid
Patch an adapter instance to acknowledge the presented certificate	PATCH <API-URL>/suite-api/api/adapters	API response of POST <API-URL>/suite-api/api/adapters	API response of POST <API-URL>/suite-api/api/adapters without adapter-certificates
Start adapter monitoring	PUT <API-URL>/suite-api/api/adapters/{adapterid}/monitoringstate/start	None	200 OK

Identify the Solution and Its Adapters

Your vRealize Operations Cloud instance may have several solutions installed. To find the vSphere solution and its adapter types, you make a GET request to retrieve a list of all solutions. The response includes all the adapters included with the solution.

For this example use case, the *API-URL* for the vRealize Operations Cloud instance is `mgmt.cloud.vmware.com`.

Prerequisites

Verify that you can log in to the API URL for a vRealize Operations Cloud instance.

Procedure

- 1 Make a GET request to list all the solutions.

```
GET https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/solutions
```

- 2 Examine the response to find the vSphere solution and its adapter types.

See the response portion of [Adapter Types for the vSphere Solution](#).

Example: Adapter Types for the vSphere Solution

This example lists all the installed solutions and the adapter types for each.

Request header:

```
GET https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/solutions
```

The response in JSON:

```
200 OK
```

```
{
  "solution":
  {
    "id": "MPforLogInsight",
    "name": "VMware vRealize Operations Management Pack for Log Insight",
```

```

    "version": "6.0.3171089",
    "description": "VMware vRealize Operations Management Pack for Log Insight... ",
    "vendor": "VMware Inc.",
    "adapterKindKeys": [
      "LogInsightAdapter"
    ]
  },
  {
    "id": "ep-ops-os-and-availability",
    "name": "Operating Systems / Remote Service Monitoring",
    "version": "1.0.4071095",
    "description": "The End Point Operations Management Solution for Operating... ",
    "vendor": "VMware Inc.",
    "adapterKindKeys": [
      "ep-ops-os-and-availability-kind"
    ]
  },
  {
    "id": "VMware vSphere",
    "name": "VMware vSphere",
    "version": "6.0.7496664",
    "description": "Manages vSphere objects such as Clusters, Hosts...",
    "vendor": "VMware Inc.",
    "adapterKindKeys": [
      "VMWARE",
      "PythonRemediationVcenterAdapter"
    ]
  }
]
}

```

The response shows three solutions installed:

- Management Pack for Log Insight solution
- End Point Operations solution
- vSphere solution

The vSphere solution has two adapter types:

- VMWARE
- PythonRemediationVcenterAdapter

For the vCenter adapter, the adapter type is VMWARE.

Identify the Object Types Required for the Adapter

After you determine that you want to create an instance of the vCenter adapter, you must identify the required object types for that adapter. You make a GET request to retrieve a list of all object types for the vCenter adapter.

Prerequisites

Verify that you know the adapter type for the vCenter adapter.

Procedure

- 1 Make a GET request to list all the object types for the vCenter adapter.

```
GET https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/adapterkinds/VMWARE/resourcekinds
```

- 2 Examine the response to identify the required object types..

See the response portion of [Object Types Required for the vCenter Adapter](#).

Example: Object Types Required for the vCenter Adapter

This example finds all the object types for the vCenter adapter.

Request header:

```
GET https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/adapterkinds/VMWARE/resourcekinds
```

Snippet of the response in JSON:

```
200 OK
```

```
{
  "key": "VmwareAdapter Instance",
  "name": "vCenter Server",
  "adapterKind": "VMWARE",
  "resourceKindType": "ADAPTER_INSTANCE",
  "resourceKindSubType": "NONE",
  "resourceIdentifierTypes": [
    {
      "name": "AUTODISCOVERY",
      "dataType": "STRING",
      "isPartOfUniqueness": false
    },
    {
      "name": "DISABLE_COMPUTATION_BASED_ON_CONSUMERS",
      "dataType": "STRING",
      "isPartOfUniqueness": false
    },
    {
      "name": "DV_PORT_GROUP_DISABLED",
      "dataType": "STRING",
      "isPartOfUniqueness": false
    },
    {
      "name": "DVS_DISABLED",
      "dataType": "STRING",
      "isPartOfUniqueness": false
    },
    {
      "name": "PROCESSCHANGEEVENTS",
      "dataType": "STRING",
      "isPartOfUniqueness": false
    }
  ]
}
```

```

    "name": "VCURL",
    "dataType": "STRING",
    "isPartOfUniqueness": true
  },
  ...
  {
    "name": "VM_LIMIT",
    "dataType": "INTEGER",
    "isPartOfUniqueness": false
  }
],
...
}

```

This snippet shows the Resource Kind with the attribute "resourceKindType": "ADAPTER_INSTANCE". Any object type that has the resource identifier "isPartOfUniqueness": true requires a value for that object type with the API request to create the adapter instance.

An adapter instance of the vCenter adapter requires a value for VCURL or the URL of the vCenter.

Create the Adapter Instance

After you identify the object types required for the adapter, you provide parameter values for the object types to create an adapter instance. Your POST request includes a request body with the required parameters.

To create an adapter instance, the VCURL setting is mandatory.

Prerequisites

Verify that you have an IP address and credentials for a vCenter.

Procedure

- 1 Make a POST request to create the adapter instance.

```
POST https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/adapters
```

- 2 Examine the response to find the name for the vSphere Solution and its adapter types.

See the response portion of [Adapter Instance](#).

Example: Adapter Instance

This example creates the adapter instance for a vCenter with the following parameters:

- Display Name: VC Adapter Instance
- Description: A vCenter Adapter Instance for VC 12.345.678.9
- vCenter Server IP address: https://12.345.678.9
- Credential name: VC-Credential-1
- User Name: administrator@vsphere.local

- Password: VC-dummy-passwd

AUTODISCOVERY and PROCESSCHANGEEVENTS are optional, but are included to show additional examples of resource identifiers in the request body and in the response.

Request header:

```
POST https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/adapters
```

Request body in JSON format:

```
{
  "name" : "VC Adapter Instance",
  "description" : "A vCenter Adapter Instance for VC 12.345.678.9",
  "collectorId" : "1",
  "adapterKindKey" : "VMWARE",
  "resourceIdentifiers" : [
    {
      "name" : "AUTODISCOVERY",
      "value" : "true"
    },
    {
      "name" : "PROCESSCHANGEEVENTS",
      "value" : "true"
    },
    {
      "name" : "VCURL",
      "value" : "https://12.345.678.9"
    }
  ],
  "credential" : {
    "id" : null,
    "name" : "VC-Credential-1",
    "adapterKindKey" : "VMWARE",
    "credentialKindKey" : "PRINCIPALCREDENTIAL",
    "fields" : [
      {
        "name" : "USER",
        "value" : "administrator@vsphere.local"
      },
      {
        "name" : "PASSWORD",
        "value" : "VC-dummy-passwd"
      }
    ]
  },
  },
}
```

Snippet of the response in JSON:

201 Created

```
{
  "resourceKey": {
    "name": "VC Adapter Instance",
    "adapterKindKey": "VMWARE",
    "resourceKindKey": "VMwareAdapter Instance",
    "resourceIdentifiers": [
      {
        "identifierType": {
          "name": "AUTODISCOVERY",
          "dataType": "STRING",
          "isPartOfUniqueness": false
        },
        "value": "true"
      },
      {
        "identifierType": {
          "name": "DISABLE_COMPUTATION_BASED_ON_CONSUMERS",

```

The API creates a new adapter with an internally generated UUID that uniquely identifies the object. The API response includes the certificates that vCenter 12.345.678.9 presents. The value of the adapter instance ID is used to start monitoring and collecting data.

Provide Proof of Certificate Validity

Before vRealize Operations Cloud can connect to the vCenter and start collecting data, it needs to verify that data sources discovered by the adapter instance are presenting valid certificates. Your PATCH request provides the proof

that the certificates are valid by including a request body that is the response from the POST request used to create the adapter.

Prerequisites

Verify that you have the response from the POST request used to create the adapter. See the response in [Adapter Instance](#).

Procedure

- ◆ Make a PATCH request to notify the system that the user has accepted the certificate presented by the vCenter.

```
PATCH https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/adapters
```

Example: Certificate Validation

In this example, the request body for the PATCH request is the same as the response from the POST request used to create the adapter instance.

Request header:

```
PATCH https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/adapters
```

Request body in JSON format:

```
{
  "resourceKey": {
    "name": "VC Adapter Instance",
    "adapterKindKey": "VMWARE",
    "resourceKindKey": "VMwareAdapter Instance",

}

```

The response is same as the request body without the `adapter-certificates` section.

Start Monitoring the New Adapter Instance

After the creating the adapter instance and configuring vRealize Operations Cloud to recognize a valid certificate, start monitoring and collecting data. Your PUT request provides the UUID of the adapter instance used to discover new objects.

Prerequisites

Verify that you have the UUID of the newly created adapter instance. See the response in [Adapter Instance](#).

Procedure

- ◆ Make a PUT request to start monitoring with the new adapter instance.

```
PUT https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/adapters/<adapter_UUID>/monitoringstate/start
```

Example: Discover Objects and Collect Data

This example starts the adapter monitoring process using the adapter instance ID from the PUT request that created the adapter instance.

Request header:

```
PUT https://www.mgmt.cloud.vmware.com/vrops-cloud/suite-api/api/adapters/a97bd204-e3e5-404b-a219-e2b20cf158d2/monitoringstate/start
```
