## Revision History

DATE	VERSION	DESCRIPTION
February 2020	2.0.2	Updates for max. connections for NSX-V and HAProxy
January 2020	2.0.1	Updates for send string for vRealize Operations 8.0
November 2019	2.0	Update for vRealize Operation 8.0
July 2019	1.9.1	Update to NSX-V prerequisites. Update F5 health check requirements
April 2019	1.9	Update to NSX-V and NSX-T configuration. Minor updates to include vRealize Operations Manager version 7.5
September 2018	1.7	Addition of NSX-T and updates to HAProxy, F5 BIG-IP Minor updates to include vRealize Operations Manager version 7.0
April 2018	1.6	Update to NSX-V and F5 configurations
April 2017	1.5	Update to include new values for interval/timeout health checks and lower the potential downtime. Minor updates to include vRealize Operations Manager 6.5
January 2017	1.4	Updates to include newer versions of load balancing software.
November 2016	1.3	Minor updates to include vRealize Operations Manager version 6.4
August 2016	1.2	Minor updates to include vRealize Operations Manager version 6.3
February 2016	1.1	Minor updates to include vRealize Operations Manager version 6.2
December 2015	1.0	Initial version.

## Introduction

This document describes the configuration of the load balancing modules of F5 Networks BIG-IP software (F5), Citrix NetScaler, HAProxy and NSX load balancers for vRealize Operations Manager. This document is not an installation guide, but a load-balancing configuration guide that supplements the vRealize Operations Manager installation and configuration documentation available in the [vRealize Operations Manager Documentation Center](#).

This information is for the following products and versions.

PRODUCT	VERSION	DOCUMENTATION
vRealize Operations Manager	6.6.1, 6.7, 7.0, 7.5, 8.0	<a href="https://docs.vmware.com/en/vRealize-Operations-Manager/index.html">https://docs.vmware.com/en/vRealize-Operations-Manager/index.html</a>
F5 BIG-IP	11.5, 11.6, 12.1, 13.0, 14.x, 15.x	<a href="https://support.f5.com/kb/en-us.html">https://support.f5.com/kb/en-us.html</a>
Citrix NetScaler	10.5*, 11.0*, 11.x, 12.x, 13.x	<a href="https://www.citrix.com/products/netscaler-adc/">https://www.citrix.com/products/netscaler-adc/</a>
NSX-V	6.1.3, 6.2.x, 6.3.x, 6.4.x	<a href="https://pubs.vmware.com/NSX-6/index.jsp#Welcome/welcome.html">https://pubs.vmware.com/NSX-6/index.jsp#Welcome/welcome.html</a>
NSX-T	2.2, 2.3, 2.4, 2.5	<a href="https://docs.vmware.com/en/VMware-NSX-T/index.html">https://docs.vmware.com/en/VMware-NSX-T/index.html</a>
HA Proxy	v1.5.x	<a href="http://www.haproxy.org/">http://www.haproxy.org/</a>
RHEL	v7.x	<a href="https://access.redhat.com/documentation/en-US/index.html">https://access.redhat.com/documentation/en-US/index.html</a>
Keepalived	v1.3.x	<a href="http://www.keepalived.org/">http://www.keepalived.org/</a>

\* Citrix NetScaler VPX versions prior to 11.0 65.35 have a bug which prevents them from using TLS 1.1/1.2. For more information, please refer to the NetScaler section of this document.

## Load Balancing Concepts

Load balancers distribute connections among servers in high availability (HA) deployments. The system administrator backs up the load balancers on a regular basis at the same time as other components.

Follow your site policy for backing up load balancers, keeping in mind the preservation of network topology and vRealize Operations Manager backup planning.

Following are the advantages of using a load balancer in front of the vRealize Operations Manager cluster:

- Utilizing a load balancer ensures that the deployed cluster is properly balanced for performance of UI traffic.
- Allows all nodes in the cluster to equally participate in the handling of UI sessions and traffic.
- Provides high availability if any admin or data node fails, by directing UI traffic only to serving nodes in the cluster.
- Provides simpler access for the users. Instead of accessing each node individually the user only needs one URL to access the entire cluster and not be concerned with which node is available.
- Provides load balancing, high availability and ease of configuration for the End Point Operations (EPOps) agents.

## Selecting a Load Balancer

There are no specific requirements for selecting a load balancer platform for vRealize Operations Manager. Majority of Load Balancers available today support complex web servers and SSL. You can use a load balancer in front of a vRealize Operations Manager cluster if certain parameters and configuration variables are followed. HAProxy was

chosen for this example due to its ease of deployment, open source availability, stability, capability handling SSL sessions, and performance. Following are some of the parameters that should be considered for configuring other brands of load balancers:

- You must use TCP Mode. HTTP mode is not supported.
- It is not recommended to use round-robin balancing mode
- Cookie persistence does not work
- SSL pass-through is used, SSL termination is not supported
- IP Hash type balancing is recommended to ensure that the same client IP address always reaches the same node, if the node is available
- Health checks should be performed with public API provided by vRealize Operations Manager.

## How to Handle SSL UI Certificates with a Load Balancer

In all the default installations of vRealize Operations Manager nodes a default self-signed VMware certificate is included. You can implement your own SSL certificate from an internal Certificate Authority or external Certificate Authority. For more information on the certificate installation procedures, see [Requirements for Custom vRealize Operations Manager SSL Certificates](#).

In addition to these configuration variables it is important to understand how SSL certificates are distributed in a cluster. If you upload a certificate to a node in the cluster, for example: the master node, the certificate will then be pushed to all nodes in the cluster. To handle UI sessions by all the nodes in the cluster you must upload an SSL certificate that contains all the DNS names (optional: IP addresses and DNS names) in the **Subject Alternative Name** field of the uploaded certificate. The common name should be the Load Balancer DNS name. The subject alternative names are used to support access to the admin UI page.

When the certificate is uploaded through admin UI page it is pushed to all the nodes in the cluster. Currently, when you use a load balancer with vRealize Operations Manager, the only supported method is SSL pass-through, which means the SSL certificate cannot be terminated on the load balancer.

To change SSL certificate on a cluster deployment:

1. Log in to the master node by using the following link: <https://<ipaddress>/admin>.
2. On the top right side, click the certificate button  to change the certificate.
3. Click on Install New Certificate
4. Click on Browse button and choose PEM certificate file.
5. After certificate verification click Install.

When you view the certificate on the node that you are accessing, you will see all nodes in the cluster listed in the certificate SAN.

## vRealize Operations Manager Overview

The vRealize Operations Manager clusters consist of a master node, an optional replica node for high availability, optional data nodes, and optional remote collector nodes. You can access and interact with the product by using the product UI available on the master and data nodes. The remote collector nodes do not contain a product UI and are used for data collection only. The product UI is powered by a Tomcat instance that resides across each node but is not load balanced out of the box. You can scale up vRealize Operations Manager environment by adding nodes when the environment grows larger.

vRealize Operations Manager supports high availability by enabling a replica node for the vRealize Operations Manager master node. A high availability replica node can take over the functions that a master node provides. When a

problem occurs with the master node, fail-over to the replica node is automatic and requires only 2 to 3 minutes of vRealize Operations Manager downtime. Data stored on the master node is always backed up on the replica node. In addition, with high availability enabled, the cluster can survive the loss of a data node without losing any data.

NODE ROLE	FUNCTIONS
Master Node	It is the initial, required node in the cluster. All other nodes are managed by the master node. It contains the product UI. In a single-node installation, the master node performs data collection and analysis as it is the only node where vRealize Operations Manager adapters are installed.
Data Node	In larger deployments, only data nodes have adapters installed to perform collection and analysis. It contains the product UI.
Replica Node	To enable high availability, the cluster requires that you convert a data node in to a replica of the master node. It does not contain product UI.

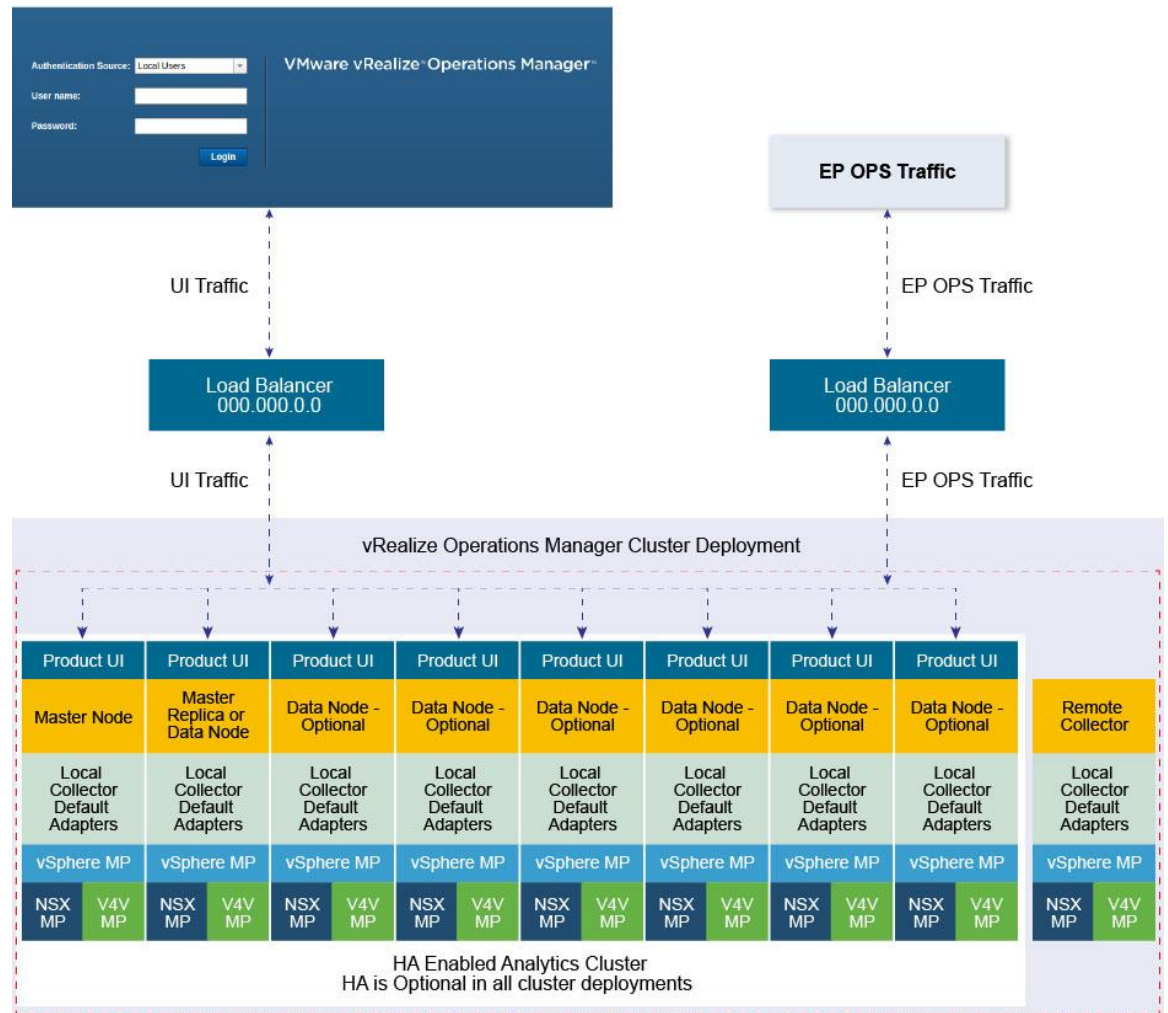

## vRealize Operations Manager Architecture

Information about vRealize Operations Manager maximum supported nodes in analytics cluster as well as other information related to High Availability can be found in the [sizing guideline document](#).

Remote collectors are not considered part of the analytics clusters as they do not participate in any type of data calculations or processing. EPOps traffic is load balanced to the same cluster.

**NOTE:** The load balancer cannot decrypt the traffic, hence cannot differentiate between EPOps and analytics traffic.

Following is a basic architecture overview of a vRealize Operations Manager 8-node cluster with high availability enabled.

**FIGURE 1. vREALIZE OPERATIONS MANAGER 8-NODES CLUSTER WITH HIGH AVAILABILITY**

## Configuring End Point Operations Agents

End Point Operations agents are used to gather operating system metrics to monitor availability of remote platforms and applications. This metrics are sent to the vRealize Operations Manager server. You can configure additional load balancer profile or dedicated load balancer to separate analytics traffic from EPOps traffic.

The steps to configure EPOps load balancer are described as required throughout this document.

You must shut down that the load balancer while upgrading or shutting down vRealize Operations Manager cluster. The load balancer should be restarted after the cluster is upgraded.

In the case of EPOps balancing, the overall latency between agent, load balancer, and cluster should be lower than 20 milliseconds. If the latency is higher, you must install a remote collector and direct the agents directly to it.

# HAProxy Installation and Configuration

HAProxy offers high availability, load balancing, and proxying for TCP and HTTP-based applications. Both multi-arm and one-arm configurations are tested and supported.

## Prerequisites

Following are the prerequisites to ensure a functional load balancer configuration and deployment.

- OS: Red Hat Enterprise Linux (RHEL) v7.x
- CPU: 2 vCPU
- Memory: 4GB
- Disk space: 50GB
- HAProxy 1.5.x
- Fully functioning DNS with both forward and reverse lookups
- All nodes in the vRealize Operations Manager cluster operating correctly
- HAProxy deployed in same datacenter and preferably on the same cluster as vRealize Operations Manager
- HAProxy not deployed on the same ESX hosts as vRealize Operations Manager cluster to ensure availability
- Minimum 2-node deployment of vRealize Operations Manager cluster
- Deployment does not require high availability to be enabled, but it is recommended that you enable high availability
- One master node and at least one data node is required for using a load balancer beneficially

## Install Single-Node HAProxy

HAProxy installation is supported and tested on Red Hat Enterprise Linux (RHEL) 7.x and can be obtained from the official Red Hat repository. You can install HAProxy on RHEL 7.x by using yum package manager. To configure HAProxy as a load-balancer for vRealize Operations Manager please follow the steps below:

1. Perform a package update on system to ensure all packages are up-to-date:

```
yum update
```

2. Install HAProxy:

```
yum -y install haproxy
```

3. Copy original HAProxy configuration to backup file:

```
cp /etc/haproxy/haproxy.cfg /etc/haproxy/haproxy.cfg.bak
```

4. Configure HAProxy configuration. To configure analytics balancer, see [Configure HAProxy Analytics](#) and to configure EPOps balancer, see [Configure EPOps HAProxy](#).

5. Allow firewall traffic through for the ports needed for HAProxy to function:

```
firewall-cmd --permanent --zone=public --add-port=80/tcp
firewall-cmd --permanent --zone=public --add-port=9090/tcp
firewall-cmd --permanent --zone=public --add-port=443/tcp
```

6. Reload the firewall configuration:

```
systemctl reload firewalld
```

7. Enable HAProxy to connect to any interface:

```
setsebool -P haproxy_connect_any 1
```

8. Enable HAProxy service:

```
systemctl enable haproxy
```

## Configure Logging for HAProxy

An administrator might want to configure logging of the HAProxy service to aid in monitoring and troubleshooting an environment. The HAProxy logger allows for the use rsyslog internally on the Linux installation to log to a local file. You can also utilize vRealize Log Insight integration to send this log to a vRealize Log Insight deployment by utilizing the new Log Insight Linux agent to greatly simplify the configuration and logging of Linux platforms. To configure basic applications logging using rsyslog locally on the server perform the following steps.

1. Configure the rsyslog configuration file to accept UDP syslog reception:

```
vi /etc/rsyslog.conf
```

2. Uncomment the following lines:

```
# Provides UDP syslog reception
$ModLoad imudp
$UDPServerAddress 127.0.0.1
$UDPServerRun 514
```

3. Save the file:

```
wq!
```

4. Create the HAProxy logging configuration file for specific application parameters

```
vi /etc/rsyslog.d/haproxy.conf
```

5. Add the following line:

```
if ($programname == 'haproxy') then -/var/log/haproxy.log
```

6. Save the file:

```
wq!
```

7. Create HAProxy Log file and set proper permissions:

```
touch /var/log/haproxy.log
chmod 755 /var/log/haproxy.log
```

8. Restart the rsyslog service:

```
Service rsyslog restart
```

## Configure HAProxy

The HAProxy configuration has been tested against an 8-node vRealize Operations Manager cluster. Clusters with fewer nodes up to a maximum of 16 analytics nodes are also supported and require the same configuration. Every time the cluster is expanded, and a new node is deployed you must edit the HAProxy configuration and add the IP address of the new node. After editing the configuration file, the HAProxy service should always be restarted so the configuration is reloaded. We recommended to set HAProxy global max. connections parameter (2000) and node max. connections parameter (140) which covers most of the cases. However, we strongly suggested to check the sizing of your environment and adjust those settings based on vROps load.

## Configure HAProxy for vRealize Operations Manager Analytics

You can configure the HAProxy for vRealize Operations Manager analytics as follows:

```
# Configuration file to balance both web and epops
#global parameters
global

    log            127.0.0.1 local2
    chroot         /var/lib/haproxy
    pidfile        /var/run/haproxy.pid
    maxconn        2000
    user           haproxy
    group          haproxy
    daemon
    stats socket   /var/lib/haproxy/stats
    ssl-server-verify none

#default parameters unless otherwise specified
defaults

    log global
    mode http
    option httplog
    option tcplog
    option dontlognull
    timeout connect 5000ms
    timeout client 50000ms
    timeout server 50000ms

#listener settings for stats webpage can be optional but highly recommended
listen stats :9090

    balance
    mode http
    stats enable
    stats auth admin:admin
    stats uri /
    stats realm Haproxy\ Statistics

#automatic redirect for http to https connections

    frontend vrops_unsecured_redirect *:80

        redirect location https://<insert_fqdn_address_here>

#front settings in this case we bind to all addresses on system or specify an interface

    frontend vrops_frontend_secure

        bind <web dedicated ip>:443
        mode tcp
        option tcplog
        default_backend vrops_backend_secure

#backend configuration of receiving servers containing tcp-checks health checks and
hashing
```

```
#needed for a proper configuration and page sessions

#adjust the server parameters to your environment

    backend vrops_backend_secure

        mode tcp
        option tcplog

    balance source
    hash-type consistent
    option tcp-check
    tcp-check connect port 443 ssl
    tcp-check send GET\ /suite-
    api/api/deployment/node/status?services=api&services=adminui&services=ui\
    HTTP/1.0\r\n\r\n

    ## For older versions of vROPS from 6.6.1 to 7.5 please use the following "tcp-
    check"

    # tcp-check send GET\ /suite-api/api/deployment/node/status\ HTTP/1.0\r\n\r\n

tcp-check expect rstring ONLINE

server node1 <Insert node1 ip address here>:443 check inter 60s check-ssl maxconn 140
fall 6 rise 6

server node2 <Insert node2 ip address here>:443 check inter 60s check-ssl maxconn 140
fall 6 rise 6

server node3 <Insert node3 ip address here>:443 check inter 60s check-ssl maxconn 140
fall 6 rise 6

server node4 <Insert node4 ip address here>:443 check inter 60s check-ssl maxconn 140
fall 6 rise 6
```

**Note:** Please make sure to use proper tcp-check call in above instruction. Starting from vROps 8.0 status API enhanced to track separate services status. Old "tcp-check" call provided above in comments.

## Configure EPOps HAProxy

You can configure EPOps HAProxy as follows:

```
# EPOPS Load Balancer configuration.

#global parameters

global

    log            127.0.0.1 local2

    chroot         /var/lib/haproxy

    pidfile        /var/run/haproxy.pid

    maxconn        2000
```

```

user      haproxy

group     haproxy

daemon

stats socket /var/lib/haproxy/stats

ssl-server-verify none

#default parameters unless otherwise specified
defaults

    log global

    mode http

    option httplog

    option tcplog

    option dontlognull

    timeout connect 5000ms

    timeout client 50000ms

    timeout server 50000ms

#listener settings for stats webpage can be optional but highly recommended

    listen stats :9090

    balance

    mode http

    stats enable

    stats auth admin:admin

    stats uri /

    stats realm Haproxy\ Statistics

#automatic redirect for http to https connections

    frontend vrops_unsecured_redirect *:80

    redirect location <Insert https fqdn here >

    frontend epops_frontend_secure

    bind <epops dedicated ip>:443

    mode tcp

    option tcplog

    use_backend epops_backend_secure

```

```

#adjust the server parameters to your environment

backend epops_backend_secure

mode tcp

option tcplog

balance source

hash-type consistent

option tcp-check

timeout queue 20s

tcp-check connect port 443 ssl

tcp-check send GET\ /epops-webapp/health-check\ HTTP/1.0\r\n

tcp-check send \r\n

tcp-check expect string ONLINE

server node1 <Insert node1 ip address here>:443 check inter 60s check-ssl maxconn 140
fall 6 rise 6

server node2 <Insert node2 ip address here>:443 check inter 60s check-ssl maxconn 140
fall 6 rise 6

server node3 <Insert node3 ip address here>:443 check inter 60s check-ssl maxconn 140
fall 6 rise 6

server node4 <Insert node4 ip address here>:443 check inter 60s check-ssl maxconn 140
fall 6 rise 6

```

**NOTE:** The line “listen stats :9090” configures the status listener of HAProxy.

## Verify HAProxy Configuration

1. When the configuration is completed, connect to [http://haproxy\\_ip\\_address:9090](http://haproxy_ip_address:9090) by using the username and password used to configure HAProxy. In the above example, username: admin and password: admin.
2. Verify that all the nodes rows are shown in green.

## Advanced Configuration: HAProxy with Keepalived

In some circumstances and deployments, dual highly available HAProxy is required. In a single-node deployment HAProxy becomes the single point of failure in the deployment and adds potential reliability concerns. Also, if the HAProxy needs patches, updates, or other maintenance, the HAProxy becomes a single point of downtime. To remediate this concern, deployment of two HAProxys and Keepalived is used to ensure one node is always available. The configuration of the HAProxy can be exactly same across nodes, simply adjusting for local node IP addresses. In most cases the first deployed HAProxy virtual machine can simply be cloned and used as the secondary node.

Failover of a failed HAProxy node by using Keepalived has been tested to occur in less than 5 seconds depending on the network variables. The failover period was rarely noticed by the user or effecting the UI session, during the limited testing. Keepalived uses Linux Virtual Router Redundancy Protocol (VRRP) and multicast advertisements from the master node. If the master node stops sending advertisements the backup proceeds to send a gratuitous ARP to the

network and taking ownership of the VIP address and owns the hardware address that master previously owned. The master and the backup monitor each other with multicast events at a rate of once per second.

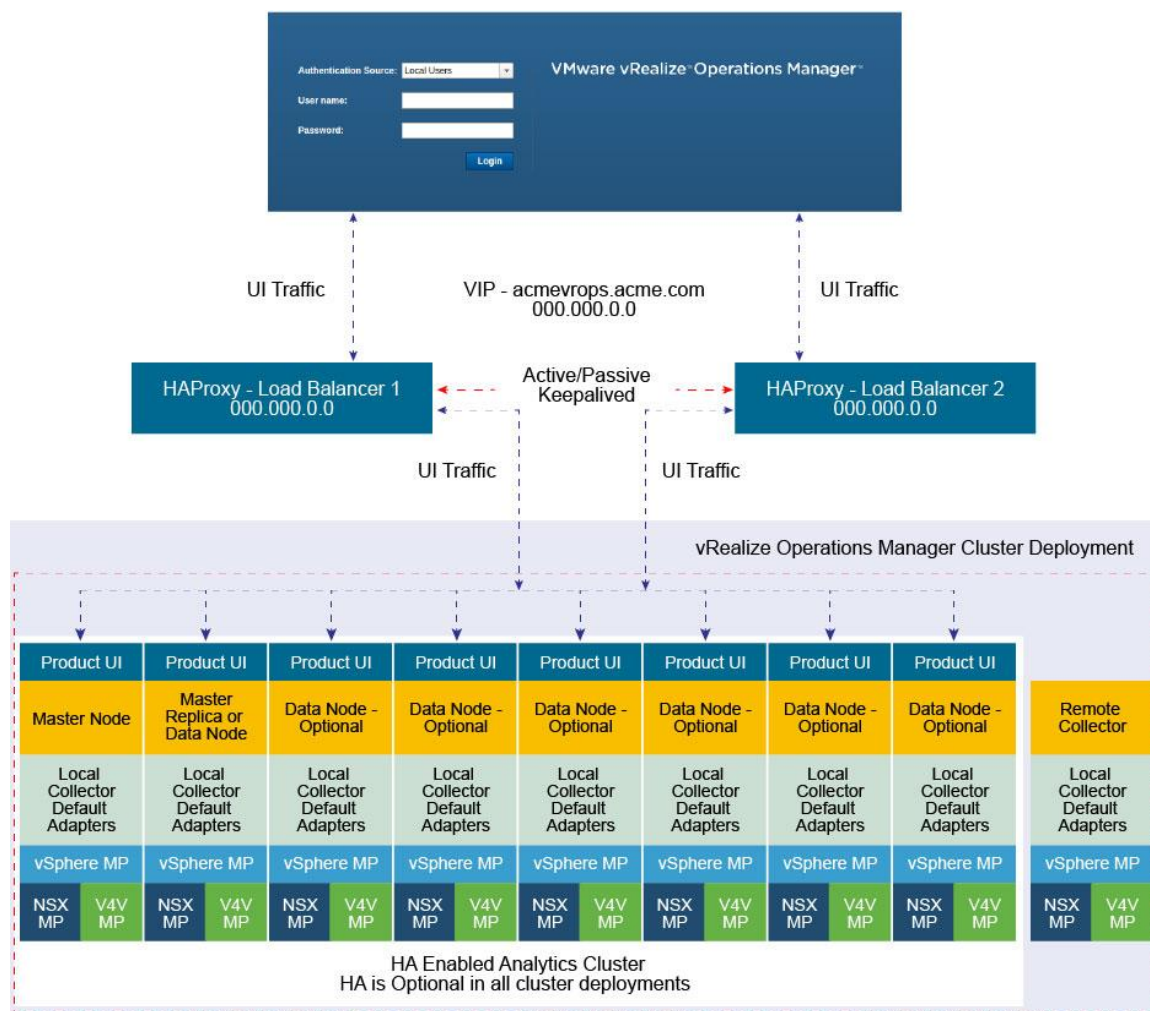

FIGURE 2. HAPROXY WITH KEEPALIVED

**FIGURE 3. vREALIZE OPERATIONS MANAGER 8-NODES CLUSTER USING HAPROXY WITH KEEPALIVED**

### Configure HAProxy with Keepalived

1. Clone the HAProxy VM or install a new VM with the same configuration as the first deployed HAProxy.
2. Change Hostname and IP Address
3. Create VIP and point to main DNS record for vRealize Operations Manager cluster. For example: acmevrops6.acme.com / 192.168.1.5)  
You will now have 2x HAProxy load balancers running. For example: LB1/192.168.1.6 and LB2/192.168.1.7.
4. Verify HAProxy configuration is located on both the load balancers. You should be able to access either one and access vRealize Operations Manager cluster successfully.

When both the HAProxies are confirmed working and contain identical configurations, you should configure the Keepalived to ensure that you have availability between the two load balancers.

5. SSH to LB1 which we will consider is the MASTER election.

```
yum install keepalived
```

6. You should configure the kernel to use a VIP to bind to vi /etc/sysctl.conf. Add the following line to the file

```
net.ipv4.ip_nonlocal_bind=1
```

7. For the kernel to pick up the new changes without rebooting, run the following command:

```
sysctl -p
```

8. Delete the file:

```
/etc/keepalived/keepalived.conf
```

9. Create a new file:

```
/etc/keepalived/keepalived.conf
```

10. In the new keepalived.conf file add the following

```
Master Node

global_defs {

    router_id haproxy2 # The hostname of this host.

}

vrrp_script haproxy {

    script "killall -0 haproxy"

    interval 2

    weight 2

}

vrrp_instance 50 {

    virtual_router_id 50

    advert_int 1

    priority 50

    state MASTER

    interface eth0

    virtual_ipaddress {

        Virtual_IPAddress dev eth0 # The virtual IP address that will be shared between
MASTER and BACKUP

    }

    track_script {

        haproxy

    }

}
```

11. Verify that above the Router\_ID is the HOSTNAME of the local load balancer that you are setting up.
12. Verify that you have set up the correct network device, check if you are using eth0.
13. Verify that above the Virtual\_IPaddress is the VIP address, and not the local IP address of the LB1 node.
14. Set the priority in increments of 50. In this example, the node has the highest priority, so it is set to 100. Verify that the node is set as the master node.
15. Save the configuration file and restart the services.
16. You must enable the Keepalived service:

```
systemctl enable keepalived
```

17. Run the commands:

```
service keepalived restart
```

```
service haproxy restart
```

18. To display if the node has the active load balancer IP, run:

```
ip a | grep eth0
```

19. If the system you are on displays the primary IP address of the load balancer, then this is the active system processing traffic. Verify that only one system displays the primary IP address of the load balancer.
20. If the address is present on both the machines, the configuration is incorrect, and both the machines might not be able to communicate with each other.
21. To configure the second LB2 Keepalived service perform the same steps as above and configure Keepalived service on LB2.
22. In the new keepalived.conf file add the following for the slave node:

```
global_defs {

    router_id haproxy4 # The hostname of this host!

}

vrrp_script haproxy {

    script "killall -0 haproxy"

    interval 2

    weight 2

}

vrrp_instance 50 {

    virtual_router_id 50

    advert_int 1

    priority 50

    state BACKUP

    interface eth0
```

```

virtual_ipaddress {
    Virtual_IPAddress dev eth0 # The virtual IP address that will be shared between
MASTER and BACKUP.

}

track_script {
    haproxy
}
}

```

23. Verify that the Router\_ID is the HOSTNAME of the local load balancer that you are setting up.
24. Verify that above the Virtual\_IPAddress is the VIP address and not the local IP address of the LB1 node.
25. Set the priority in increments of 50. In this example, the node has the highest priority, so it is set to 100. Verify that the node is set as the backup.
26. Save the configuration file and restart the services.
27. You must enable the Keepalived service:

```
systemctl enable keepalived
```
28. Run the commands:

```
service keepalived restart
service haproxy restart
```
29. To display if the node has the active load balancer IP, run:

```
ip a | grep eth0
```
30. If the system you are on displays the primary IP address of the load balancer, then this is the active system processing traffic

## F5 Big IP Installation & Configuration

The F5 Big IP load balancer configuration is similar to the HAProxy configuration. The F5 uses the SSL pass-through in the same manner as the HAProxy configuration. The F5 configuration has been tested in both one-arm and multi-arm topologies.

### Prerequisites

The following are the prerequisites for a functional F5 configuration in front of a vRealize Operations Manager cluster:

- This document assumes that an F5 device is already deployed in the environment and is configured with network connectivity to the deployed environment where the load balancer instance would be used and run from.
- The F5 can be either physical or virtual and can be deployed in one-arm or multi-arm topologies
- The Local Traffic Module (LTM) must be configured and licensed as Nominal, Minimum, or Dedicated. You can configure LTM on System > Resource Provisioning page.
- A vRealize Operations Manager cluster has been deployed in the environment and is fully functional and all nodes in the cluster are accepting UI traffic. This cluster might have high availability enabled but it is not a requirement.
- An additional VIP/Virtual Server IP address for vRealize Operations Manager analytics.
- An additional VIP/Virtual Server IP address for EPOps in case you are configuring separate load balancers for analytics and EPOps.

### Configure Custom Persistence Profile

There are multiple possible profiles provided out of box in most F5 deployments and creating a custom persistence profile using source addresses affinity. You must create a customer persistence profile by using the following steps:

1. Log in to the F5 and select **Local Traffic > Profiles > Persistence**.
2. Click **Create**.
3. Enter the name **source\_addr\_vrops** and select **Source Address Affinity** from the drop-down menu.
4. Enable **Custom** mode.
5. Set the **Timeout** to **1800 seconds (30 minutes)**.
6. Click **Finished**.

**NOTE:** The timeout of the vRealize Operations Manager user sessions, configured through the Global Settings page is 30 minutes is, consistent with vRealize Operations Manager configuration. If the timeout value is updated for vRealize Operations Manager, it should be updated for F5 too.

Example for vRealize Operations Manager analytics configuration:

General Properties	
Name	source_addr_vrops
Partition / Path	Common
Persistence Type	Source Address Affinity
Parent Profile	source_addr ▼

Configuration	
Match Across Services	<input type="checkbox"/>
Match Across Virtual Servers	<input type="checkbox"/>
Match Across Pools	<input type="checkbox"/>
Hash Algorithm	Default ▼
Timeout	Specify... ▼ 1800 seconds
Prefix Length	None ▼
Map Proxies	<input checked="" type="checkbox"/> Enabled
Override Connection Limit	<input type="checkbox"/>

Example for EPOps configuration:

General Properties	
Name	source_addr_epops
Partition / Path	Common
Persistence Type	Source Address Affinity
Parent Profile	source_addr ▼

Configuration	
Match Across Services	<input type="checkbox"/>
Match Across Virtual Servers	<input type="checkbox"/>
Match Across Pools	<input type="checkbox"/>
Hash Algorithm	Default ▼
Timeout	Specify... ▼ 1800 seconds
Prefix Length	None ▼
Map Proxies	<input checked="" type="checkbox"/> Enabled
Override Connection Limit	<input type="checkbox"/>

## Configure Health Monitors

Health monitors are required to ensure the F5 has the proper endpoints on the vRealize Operations Manager node to test to make sure the node is available and functioning for clients to access the node. In this case, create a few Health Monitors to ensure all URLs are checked properly for availability.

1. Log in to the F5 and from the main menu select **Local Traffic > Monitors**.
2. Click **Create** and provide the required information as shown in the following tables. Leave the default when nothing is specified.

vRealize Operations Manager Analytics configuration:

NAME	TYPE	INTERVAL	TIMEOUT	SEND STRING	RECEIVE STRING	DESCRIPTION
vrops_https	https	20	61	GET /suite-api/api/deployment/node/status?services=api&services=adminui&services=ui \r\n ----- Note: For older versions of vROPS from 6.6.1 to 7.5 please use the following URL call, as starting from vROps 8.0 status API enhanced to track separate services status. GET /suite-api/api/deployment/node/status \r\n	ONLINE	Default HTTPS monitor to ensure the HTTPS page is accessible

EPOPS configuration:

NAME	TYPE	INTERVAL	TIMEOUT	SEND STRING	RECEIVE STRING	DESCRIPTION
vrops_epops	https	20	61	GET /epops-webapp/health-check HTTP/1.0\r\n	ONLINE	Heartbeat page used to monitor the epops health

Example for vRealize Operations Manager analytics configuration:

**Local Traffic » Monitors » vrops\_https**

Properties

Instances

**General Properties**

Name	vrops_https

Reverse	<input type="radio"/> Yes <input checked="" type="radio"/> No
Transparent	<input type="radio"/> Yes <input checked="" type="radio"/> No
Alias Address	* All Addresses
Alias Service Port	* All Ports
Adaptive	<input type="checkbox"/> Enabled

Update Delete

## Configure Server Pools

Server Pools are used to contain the pools of members or nodes that will be receiving traffic. You will only need to create a single pool for a vRealize Operations Manager cluster with all nodes participating in the UI traffic as members. In most cases, you will add each node in the cluster except for the remote collectors.

1. Log in to the F5 load balancer and select **Local Traffic > Pools**.
2. Click **Create** and provide the required information. Leave the default when nothing is specified.
3. Enter each pool member as a **New Node** and add it to the **New Members**.

4. Repeat steps 1, 2, and 3 for each row of information in the following table.
5. On the **Members** page, select the **Load Balancing Method** as the **Least Connections (node)** and **Priority Group Activation** as **Disabled**.

vRealize Operations Manager Analytics configuration:

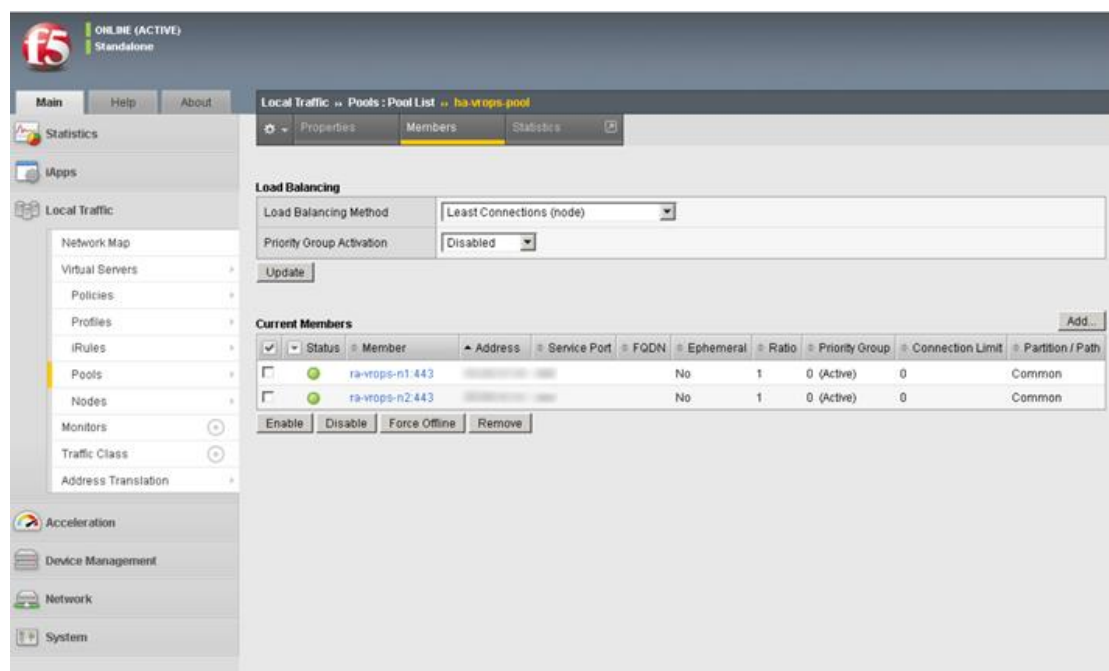

NAME	DESCRIPTION	HEALTH MONITORS	LOAD BALANCING METHOD	NODE NAME
ha-vrops-prod	vRealize Operations Manager Pool	vrops_https	Least Connections	vrops_node1:<ipaddress> vrops_node2:<ipaddress> vrops_node3:<ipaddress>

EPOps configuration:

NAME	DESCRIPTION	HEALTH MONITORS	LOAD BALANCING METHOD	NODE NAME
ha-epops-prod	vRealize Operations Manager Pool	vrops_epops	Least Connections	vrops_node1:<ipaddress> vrops_node2:<ipaddress> vrops_node3:<ipaddress>

**NOTE:** Ensure that you are using the correct service port: 443 for SSL.

Example:

## Configure Virtual Servers

Virtual servers contain the virtual IP address (VIP) for the pools of nodes that will be accessed. In this case, there are two separate VIP's created with the same IP address. One virtual server will be for insecure traffic which will leverage a custom iRule to ensure the traffic gets redirected properly to the HTTPS session. The second virtual server will be used for secure traffic to ensure traffic will be sent directly to the secure HTTPS web page normally.

1. Log in to the F5 load balancer and select **Local Traffic** > **Virtual Servers**.
2. Click **Create** and provide the required information. Leave the default when nothing is specified.
3. When all the settings are configured, click **Update** to create the first virtual server.
4. Repeat the steps to configure the second virtual server by using the settings in the table below.

NAME	TYPE	DESTINATION ADDRESS	SERVICE PORT	HTTP PROFILE	SERVICE ADDRESS TRANSLATION	DEFAULT POOL	DEFAULT PERSISTENCE PROFILE	IRULES
ra-vrops-vip-http	Standard	<ipaddress>	80	HTTP	Auto Map	None	None	_sys_https_redirect
ra-vrops-vip	Performance (Layer 4)	<ipaddress>	443	None	Auto Map	ha-vrops-prod	source_addr_vrops	None
epops-vip	Performance (Layer 4)	<ipaddress>	443	None	Auto Map	ha-epops-prod	source_addr_vrops	None

Example:

The screenshot displays the vRealize Operations Manager interface. The top navigation bar includes 'Main', 'Help', and 'About'. The left sidebar shows a tree view with categories like 'Statistics', 'Apps', 'Local Traffic', 'Acceleration', 'Device Management', 'Network', and 'System'. The 'Local Traffic' category is expanded, showing sub-items like 'Network Map', 'Virtual Servers', 'Policies', 'Profiles', 'iRules', 'Pools', 'Nodes', 'Monitors', 'Traffic Class', and 'Address Translation'. The 'Virtual Servers' sub-item is selected, leading to the 'Virtual Server List' page. The selected virtual server is 'ra-wrops-vip-http'.

The main content area shows the configuration for the selected virtual server. It is divided into three sections: 'General Properties', 'Configuration', and 'Acceleration'.

**General Properties:**

Name	ra-wrops-vip-http
Partition / Path	Common
Description	
Type	Performance (Layer 4)
Source Address	0.0.0.0
Destination Address	
Service Port	80 HTTP
Notify Status to Virtual Address	<input checked="" type="checkbox"/>
Availability	Available (Enabled) - The virtual server is available
Syncookie Status	Off
State	Enabled

**Configuration:** Basic

Protocol	TCP
Protocol Profile (Client)	TcpL4
HTTP Profile	http
VLAN and Tunnel Traffic	Enabled on:
VLANs and Tunnels	<div> <div>Selected</div> <div> <div>Common</div> <div>SiteA-Res1</div> </div> </div> <div> <div>Available</div> <div> <div>Common</div> <div>SiteA-Mgmt</div> <div>SiteA-Res2</div> <div>http-tunnel</div> <div>rocky-tunnel</div> </div> </div>
Source Address Translation	Auto Map

**Acceleration:** Basic

Rate Class	None
SPDY Profile	None

Buttons: Update, Delete

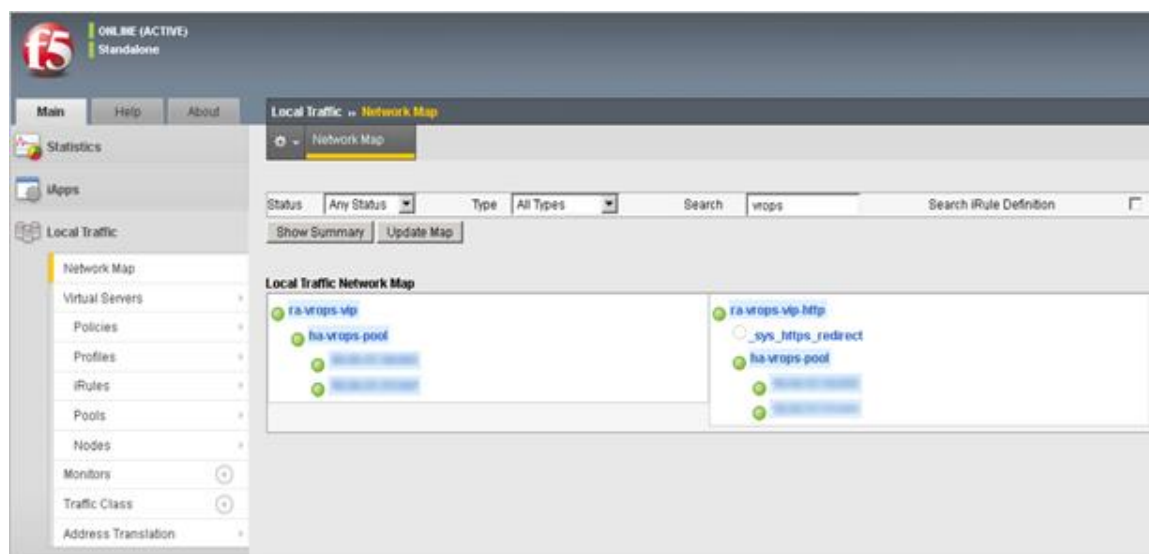

## Verify Component and Pool Status

After completing configuration for health monitors, server pools, and virtual servers, verify the status of the configured environment and filter to the specific deployment that was just configured to get an overall view of the nodes, pools, and virtual servers.

1. To check the network map for an overall view of the server pools, select **LTM > Network Map**.
2. Filter the **Network Map** by using the search box to enter the name of the virtual server name used in the configuration.
3. Each status indicator represents the status of the node, the pool, and virtual server or assigned VIP.

Example:

In the following example, you can see both the ra-vrops-vip and the ra-vrops-vip-http VIP are functioning normally. When one of the nodes fail, the indicator will turn red and the indicator for the pool turns yellow to represent a failure in the pool.

# Citrix NetScaler Installation & Configuration

Before starting with this configuration make sure that the Netscaler device is deployed in the environment and has access to the vRealize Operations components.

- You can use either virtual or physical Netscaler in single or clustered configuration.
- Enable the **Load Balancer (LB)** and **SSL** modules. You can do so from the **NetScaler > System > Settings > Configure Basic Features** page.
- In case you experience SSL timeout issues with the virtual edition of NetScaler please update the appliance to version 11.0 65.35 or disable TLS 1.1/1.2 as per article <http://support.citrix.com/article/CTX205578>. This is a known NetScaler bug – reference ID: 600155.
- You can use either multi-arm or one-arm configuration. Our tests were done in multi-arm configuration.
- VPX versions of Netscaler doesn't support certificates larger than 2048bits on the back-end servers. If you are planning to use VPX you will need to change the vRealize Operations certificate. Please refer to the articles below for more information.

[Configure a certificate for use with vRealize Operations Manager](#)

[FAQ: Key Sizes/Certificates Supported by NetScaler](#)

## Configure Health Monitors

1. Log in to the Netscaler load balancer and select **NetScaler > Traffic Management > Load Balancing > Monitors**.
2. Click **Add** and provide the required information. Leave the default when nothing is specified.
3. Repeat steps 1 and 2 for each row of information in the table below.

vRealize Operations Manager Analytics configuration:

NAME	TYPE	INTERVAL	TIMEOUT	RETRIES	SEND STRING	RECEIVE STRING	DEST. PORT	SECURE
vrops_http	HTTP	16 sec.	15 sec.	3	GET /	(200 204 301)	80	no
vrops_https	HTTP-EVC	16 sec.	15 sec.	3	GET /suite-api/api/deployment/node/status?services=api &services=adminui&services=ui  ----- Note: For older versions of vROPS from 6.6.1 to 7.5 please use the following URL call, as starting from vROps 8.0 status API enhanced to track separate services status.  GET /suite-api/api/deployment/node/status \r\n	ONLINE	443	yes

vrops_epops	HTTP-EVC	16 sec.	15 sec.	3	GET /epops-webapp/health-check	ONLINE	443	yes

## NSX-V Installation & Configuration

The NSX-V virtual networking solution includes the capability of deploying an Edge gateway as a load balancer. Currently, the NSX-V load balancer has basic load balancing functionality and it should not be considered a full-fledged load balancer with advanced configuration like F5.

**NOTE:** Use NSX-V version 6.1.3 and higher for all deployments as many issues with the load balancers have been resolved in this release.

### Prerequisites

The following are the prerequisites for a functional NSX-V load balancer in front of a vRealize Operations Manager cluster:

- This document assumes that NSX-V deployment is already deployed in the environment and is fully functional.
- The NSX-V deployment is of version 6.1.3 or higher.
- NSX-V Edge is deployed and has access to the network on which vRealize Operations Manager cluster is deployed.
- Edge can be enabled for high availability, however it is not a requirement
- Currently, there are 2 types of modes the load balancer can be used: Accelerated and Non-Accelerated. Accelerated mode uses L4 and LVS and non-accelerated mode uses L7

### Install and Configure Edge for Load Balancing

You can specify global load balancer configuration parameters and configure the NSX-V Edge for load balancing by enabling the load balancer service.

1. Log in to the vSphere Web Client.
2. Click **Networking & Security** and then click **NSX Edges**.
3. Double-click an NSX-V Edge.
4. Click **Manage** and then click the **Load Balancer** tab.
5. Click **Edit** and select **Enable Load Balancer** and **Enable Acceleration**
6. Click **OK** to save changes and enable the service on the Edge.

Example from NSX-V 6.2.0:

**Edit Load balancer global configuration**

☒ Enable Load Balancer

☒ Enable Acceleration

☐ Logging

Log Level: **Info** ▼

☐ Enable Service Insertion

Service Definition: ▼

Service Configuration: ▼

Deployment Specification: ▼

Runtime NICs | Attributes | Typed Attributes

Name	Connected To	ConnectivityType	IP Address	Subnet Mask	Gateway Address

OK Cancel

## Configure Application Profiles

You must create an application profile to define the behavior of a particular type of network traffic. After configuring a profile, you should associate the profile with a virtual server. The virtual server then processes traffic according to the values specified in the profile. Using profiles enhances your control over managing network traffic and makes traffic-management tasks easier and more efficient.

1. Log in to the vSphere Web Client.
2. Click **Networking & Security** and then click **NSX Edges**.
3. Double-click an NSX Edge.
4. Click **Manage** and then click the **Load Balancer** tab.
5. In the left navigation panel, click **Application Profiles**.
6. Click the Add (+) icon.
7. Enter a name for the profile and select the traffic type for which you are creating the profile. For example: vrops\_https.
8. Select the **Type: HTTPS**
9. Select **Enable SSL Passthrough**.
10. Select **Persistence** as **Source IP**.

11. Enter **1800** for **Expires in (seconds)**.
12. Select **Ignore** for **Client Authentication**.
13. Click **OK** to save the Profile

NOTE: When the encrypted traffic is balanced, the load balancer cannot differentiate between the traffic for vRealize Operations Manager analytics and EPOps. If you plan to use two load balancers, one for vRealize Operations Manager analytics and one for EPOps, you could use the same profile as both the profiles are identical. If you create two different profiles, only the name of the profiles is different, but the configurations for both the profiles are identical.

Example:

**Edit Profile**

Name:

Type:

☒ Enable SSL Passthrough

HTTP Redirect URL:

Persistence:

Cookie Name:

Mode:

Expires in (Seconds):

☐ Insert X-Forwarded-For HTTP header

☐ Enable Pool Side SSL

Virtual Server Certificates Pool Certificates

Service Certificates CA Certificates CRL

Common Name	Issuer	Validity

Cipher:

Client Authentication:

**OK Cancel**

## Add Service Monitoring

Configuring service monitoring is similar to creating health checks on other platforms. In NSX-V 6.1, there is a limitation on how many health checks can be performed against a single node. Currently, you can only have a single health check run against a node to ensure availability.

When you associate a service monitor with a pool, the pool members are monitored according to the service monitor parameters. To configure a Service Monitor, perform the following steps.

1. Log in to the vSphere Web Client
2. Click **Networking & Security** and then click **NSX Edges**.
3. Double-click an NSX Edge.

4. Click **Manage** and then click the **Load Balancer** tab.
5. In the left navigation panel, click **Service Monitoring**.
6. Click the Add (+) icon.
7. Enter a name for the service monitor. For example: vROps\_Monitor
8. Enter an **Interval** at which a server is to be pinged.
9. Enter a **Timeout** in seconds, maximum time within which a response from the server must be received.
10. Enter the number of times the server must be pinged before it is declared down.
11. Select the **Method** in which you want to send the health check request to the server. For example: GET.
12. Insert the health check URL as shown in the following table.
13. Enter the **Receive** data string needed for a successful health check response. For example: ONLINE.
14. Click **OK** to save the new Service Monitor.

NAME	INTERVAL	TIMEOUT	RETRIES	TYPE	METHOD	URL	RECEIVE:
vROps_Monitor	5	16	3	HTTPS	GET	/suite-api/api/deployment/node/status?services=api&services=adminui&services=ui  <hr/> Note: For older versions of vROPS from 6.6.1 to 7.5 please use the following URL call, as starting from vROps 8.0 status API enhanced to track separate services status.  /suite-api/api/deployment/node/status \r\n	ONLINE (upper case)
EPPOS_Monitor	5	16	3	HTTPS	GET	/epops-webapp/health-check	ONLINE (upper case)

Example:

**Edit Service Monitor**

Name: \*vROps\_Monitor

Interval: 5 (seconds)

Timeout: 16 (seconds)

Max Retries: 3

Type: HTTPS

Expected:

Method: GET

URL: /suite-api/api/deployment/node/status

Send:

Receive: ONLINE

Extension:

OK Cancel

## Add Pools

You can add a server pool to manage and share backend servers, flexibly and efficiently. A pool manages load balancer distribution methods and has a service monitor attached to it for health check parameters.

1. Log in to the vSphere Web Client.
2. Click **Networking & Security** and then click **NSX Edges**.
3. Double-click an NSX Edge.
4. Click **Manage** and then click the **Load Balancer** tab.
5. In the left navigation panel, click **Pools**.
6. Enter a name for the load balancer pool. For example: vROps\_Pool.
7. (Optional) Enter a description.
8. Select an **Algorithm** from the drop-down list. For example: LEASTCONN.
9. Select the **Monitors** from the drop-down list. For example: vROps\_Monitor.
10. Click the Add (+) icon to add your member servers and the required information:
  - a. Name
  - b. IP Address
  - c. Weight: 1

- d. Monitor Port: 443
- e. Port: 443
- f. Max Connections: 0
- g. Min Connections: 0

POOL NAME	ALGORITHM	MONITORS	MEMBER NAME	IP ADDRESS/V CENTER CONTAINER	WEIGHT	PORT	MONITOR PORT	MAX CONNS	MIN CONNS
vROps_Pool	LEASTCONN	vROps_Monitor	vROps_Node1	x.x.x.x	1	443	443	0	0
EPOps_Pool	LEASTCONN	EPOps_Monitor	EPOps_Node1	x.x.x.x	1	443	443	0	0

Example:

**Edit Pool**

Name: \* vROps\_Pool

Description:

Algorithm: LEASTCONN

Algorithm Parameters:

Monitors: vROps\_Monitor

Members:

Enabled	Name	IP Address / VC Container	Weight	Monitor Port	Port	Max Connections	Min Connection.
✓	ra-vrops...		1	443	443	0	0
✓	ra-vrops...		1	443	443	0	0

☐ Transparent

OK Cancel

## Add Virtual Servers

You can add an NSX Edge internal or uplink interface as a virtual server.

1. Log in to the vSphere Web Client.

2. Click **Networking & Security** and then click **NSX Edges**.
3. Double-click an NSX Edge.
4. Click **Manage** and then click the **Load Balancer** tab.
5. In the left navigation panel, click **Virtual Servers**.
6. Click the Add (+) icon.
7. Enter a name for the virtual server. For example: vROps\_Virtual\_Server
8. Select **Enable Virtual Server** and **Enable Acceleration**.
9. Select the **Application Profile** name from the drop-down list. For example: Exp: vrops\_https
10. Enter a **Name** for the virtual server.
11. (Optional) Enter a description.
12. Enter the IP Address to be used for the VIP.
13. From the drop-down list for **Protocol**, select **HTTPS**.
14. Enter the **Port** value as 443.
15. From the drop-down list for **Default Pool**, select the default pool that you have configured. For example: vROps\_Pool
16. For **Connection Limit** and **Connection Rate Limit**, leave the default as 0.

**NOTE:** If you are using separate load balancers for vRealize Operations Manager and EPOps, the above steps need to be repeated for EPOps virtual server. Use different names for EPOps profile and respective pool. For example: epops\_http and EPOPS\_Pool.

Example:

**Edit Virtual Server**

Gene... Advanced

☒ Enable Virtual Server

☒ Enable Acceleration

Application Profile: vrops\_https

Name: \* vrops\_https

Description:

IP Address: \*  Select IP Address

Protocol: HTTPS

Port / Port Range: \* 443

Default Pool: vROPS\_POOL

Connection Limit: 0

Connection Rate Limit: 0 (CPS)

OK Cancel

## Configure Auto Redirect from HTTP to HTTPS

When using the NSX-V load balancer in front of the vRealize Operations Manager cluster you may want the URL to automatically redirect to the HTTPS login page. If you do not configure this the user will need to insert the https field in front of the URL/IP Address. Similar setting is also required in a HAProxy configuration to ensure the redirect works properly. You must configure application profiles and virtual servers for HTTPS redirect.

**NOTE:** Ensure that you are using the HTTPS URLs in a correct manner.

### Configure Application Profile for HTTPS Redirect

1. Log in to the vSphere Web Client.
2. Click **Networking & Security** and then click **NSX Edges**.
3. Double-click an NSX Edge.
4. Click **Manage** and then click the **Load Balancer** tab.
5. In the left navigation panel, click **Application Profiles**.
6. Click the Add (+) icon.
7. Enter a name for the Application Profile. For example: vROps\_Redirect
8. From the drop-down list for **Type**, select **HTTP**.
9. For **HTTP Redirect URL**, enter https://<ip\_address\_of\_vip>/vcops-web-ent/login.action.
10. From the drop-down list for **Persistence**, select **Source IP**.
11. Enter **1800** for **Expires in (seconds)**.

12. Click **OK** to save.

Example:

**Edit Profile**

Name: vrops\_redirect

Type: HTTP

☐ Enable SSL Passthrough

HTTP Redirect URL: https://vrops-web-ent/c

Persistence: Source IP

Cookie Name:

Mode:

Expires in (Seconds): 1800

☐ Insert X-Forwarded-For HTTP header

☐ Enable Pool Side SSL

Virtual Server Certificates Pool Certificates

Service Certificates CA Certificates CRL

Common Name	Issuer	Validity

Cipher:

Client Authentication: Ignore

OK Cancel

## Configure the Virtual Server for HTTPS Redirect

You can configure the virtual server for HTTPS redirect.

1. Log in to the vSphere Web Client.
2. Click **Networking & Security** and then click **NSX Edges**.
3. Double-click an NSX Edge.
4. Click **Manage** and then click the **Load Balancer** tab.
5. In the left navigation panel, click **Virtual Servers**.
6. Click the Add (  ) icon.
7. Select **Enable Virtual Server**.
8. Select an **Application Profile** from the drop-down list that you have created. For example: vrops\_redirect
9. Enter a **Name** for the virtual server.
10. (Optional) Enter a **Description**.
11. Enter IP Address for the VIP.
12. From the drop-down list for **Protocol**, select **HTTP**.

13. Enter the **Port** value as 80.
14. From the drop-down list for **Default Pool**, select **None**.  
For NSX-V versions 6.2.7 and 6.3.0, create an empty pool and assign it as the default pool.
15. For **Connection Limit** and **Connection Rate Limit**, leave the default as 0.

Example:

**Edit Virtual Server**

Gene... Advanced

☒ Enable Virtual Server

☒ Enable Acceleration

Application Profile: vrops\_redirect

Name: \* vrops\_redirect

Description:

IP Address: \*  [Select IP Address](#)

Protocol: HTTP

Port / Port Range: \* 80

Default Pool: NONE

Connection Limit: 0

Connection Rate Limit: 0 (CPS)

OK Cancel

## Verify Component and Pool Status

You can verify the status of the components running on the load balancer and you can check the status of the pools from inside the UI of the vSphere Web Client.

1. Log in to the vSphere Web Client.
2. Click **Networking & Security** and then click **NSX Edges**.
3. Double-click an NSX Edge.
4. Click **Manage** and then click the **Load Balancer** tab.
5. In the left navigation panel, click **Pools**.
6. Select the pool you want to verify. For example: vROps\_Pool.
7. Click **Show Pool Statistics**. A **Pool and Member Status** pop-up window appears.

8. Select a pool ID. For example: vROps\_Pool.

The member ID and status of the selected pool are displayed. The status can be **UP** or **DOWN**.

Example:

Pool and Member Status

Pool Status and Statistics:

Pool ID	Name	Status
pool-2	vROps_Pool	UP

Member Status and Statistics:

Name	IP Address / VC Container	Status	Member ID
ra-vrops-01		UP	member-4
ra-vrops02		UP	member-5

## NSX-T Installation & Configuration

The NSX-T virtual networking solution includes the capability of deploying an Edge gateway as a load-balancer. It offers high availability and load balancing for TCP and HTTP-based applications.

**NOTE:** Please use NSX-T version 2.2 or higher if you like to handle SSL Certificates within the load-balancer.

### Prerequisites

The following are the prerequisites for a functional NSX-T load balancer in front of a vRealize Operations Manager cluster:

- This document assumes that NSX-T is already deployed in the environment and is fully functional
- The NSX-T deployment is version 2.2 or higher
- NSX-T Edge has access to the network on which the vRealize Operations Manager cluster is deployed
- NSX-T Tier-1 edge for load balancing is configured
- A vRealize Operations Manager cluster has been deployed in the environment and is fully functional with all nodes in the cluster accepting traffic. The cluster might have high availability enabled, but it is not a requirement
- 1 Virtual Server IP address for vRealize Operations Manager analytics

An additional VIP/Virtual Server IP address for EPOps traffic, in case of separate load balancers is used for analytics and EPOps

## NSX-T Version 2.2, 2.3

### Configure Application Profiles

Application profile must be created to define the behavior of a particular type of network traffic.

For NSX-T, two application profiles need to be created to:

1. Redirect HTTP to HTTPS
2. Handle HTTPS traffic

After the configuration of an application profile, the same should be associated with a virtual server. The virtual server then processes traffic according to the options specified in the application profile.

**Log in to the NSX-T UI:**

**Configure the Application Profile for HTTP requests:**

- Go to **Load Balancing -> Virtual Servers -> Application Profiles**
- Click the **Add** (  ) icon and choose **HTTP Profile**.
- Choose a name for the profile and enter parameters (please refer to the example below)

**Edit HTTP Profile** ⓘ ✕

Name \*

Description

Purge Entries when Full Enabled ☒

**CANCEL** **OK**

## Add Active Health Monitor

Configuring active health monitoring is similar to creating health checks on other load-balancers. When you associate an active health monitor with a pool, the pool members are monitored according to the active health monitor parameters. To configure an **Active Health Monitor**, perform the following steps:

- Go to **Load Balancing** → **Server Pools** → **Active Health Monitors**

- Click the **Add** (  ) icon
- Choose a name for the active health monitor and enter **Monitor Properties** (please refer to the example below)

**Note:** LbHttpsMonitor is pre-configured monitor for HTTPS protocol and it can be used for this Active Health Monitor

- Configure Health check parameters with the following values:

- Request Method  
GET
- Request URL  
/suite-api/api/deployment/node/status?services=api&services=adminui&services=ui
- Request Version  
HTTP\_VERSION\_1\_1
- Response Status Codes  
200, 204, 301
- Response Body  
ONLINE (upper case)
- Ciphers

TLS\_ECDHE\_RSA\_WITH\_AES\_128\_GCM\_SHA256,  
 TLS\_ECDHE\_RSA\_WITH\_AES\_256\_GCM\_SHA384, TLS\_ECDHE\_RSA\_WITH\_AES\_256\_CBC\_SHA,

## Configure Server Pools

NSX-T Server Pools are used to contain the nodes that are receiving traffic. You will need to create a single pool per vRealize Operations Manager cluster with all the data nodes participating in the cluster as members. Remote collectors should not be added into this pool.

### Configure a Server Pool:

- Go to **Load Balancing** → **Server Pools** → **Server Pools**
- Click the **Add** (  ) icon
- Choose a **Name** for the pool. For example: vROPS-POOL
- Set **Load Balancing Algorithm** as LEAST\_CONNECTION
- Configure **SNAT Translation** as **Auto Map**
- Add the pool members (vRealize Operations Manager data nodes IP addresses and Port)
  - Name
  - IP Address
  - Weight: 1
  - Port: 443
  - State: ENABLED
- Attach an **Active Health Monitor** to the pool (please refer to the example below)

POOL NAME	ALGORITHM	MONITORS	MEMBER NAME	IP ADDRESS	WEIGHT	PORT	STATE
vROPS-POOL	LEASTCONN	vROPS_MONITOR	vROPS_NODE1	x.x.x.x	1	443	ENABLED
EOPS-POOL	LEASTCONN	EOPS_Monitor	EOPS_NODE1	x.x.x.x	1	443	ENABLED

Three Modes based on the topology are supported. In case of Inline deployment of Load Balancer, use Transparent (NO\_SNAT) to preserve original Client IP and Port. Auto Map mode uses LB interface IP and ephemeral port. In scenarios where both Clients and Pool Members are attached to the same Logical Router, SNAT (Auto Map or IP List) must be used.

## Configure Virtual Servers

NSX-T Virtual Servers contain the Virtual IP address (VIP) for the pools of nodes that will be accessed. In this case, there are two separate VIPs created with the same IP address. One virtual server is used for redirecting insecure HTTP (port 80) traffic to a secure-channel connection – HTTPS (port 443). The second virtual server is used for handling and forwarding secure-channel traffic (HTTPS) to the backend systems.

### Configure the Virtual Servers for HTTP requests:

- Go to **Load Balancing** → **Virtual Servers** → **Virtual Servers**
- Click the **Add** (  ) icon
- Choose a name for Virtual Server
- Configure **Application Type** as **Layer 7**
- Assign appropriate **Application Profile** (please refer to the example below)
- Assign VIP (Virtual IP) and port 80 to handle HTTP requests
- Add **Default Pool Member Port** 80
- Assign appropriate **Persistent Profile** (please refer to the example below)

**Note:** There is no need to configure any Server Pool for this Virtual Server

## Configure Load Balancer

You need to specify a load-balancer configuration parameter and configure the NSX-T appliance for load balancing by creating the respective service.

- Go to **Load Balancing** → **Load Balancers**
- Click the **Add** (  ) icon
- Choose a name, select appropriate sizing (depends on vROPS cluster size) and error log level and press OK
- Attach the previously created during installation and configuration “Tier 1 Logical Router” to the newly created Load Balancer (**Overview** → **Attachment** → **EDIT**)
- Attach the previously created Virtual Servers for HTTP and HTTPS to the Load Balancer (Virtual Servers → ATTACH)

Name \*

The screenshot shows the vRealize Operations Manager interface. On the left is a navigation pane with categories: Tools, Load Balancing (expanded), Virtual Servers, Server Pools, Firewall, Routing, DDI, and Switching. Under Load Balancing, 'Load Balancers' is highlighted. The main area displays a list of Load Balancers. One is selected and highlighted in blue, showing a checkmark and the name 'VROPS'. To the right of the list is a configuration panel for the selected Load Balancer. It has tabs for 'Summary' and 'Attachment'. The 'Summary' tab is active, showing fields: Name, ID, Description, Operational Status, LB Size, Access Log, and Error Log Level. The 'Attachment' tab is also visible, showing fields: Tier-1 Router, Active Edge Node, and Standby Edge Node. At the bottom of the panel are 'Manage Tags' and 'EDIT' links.

## Attach to a Logical Router

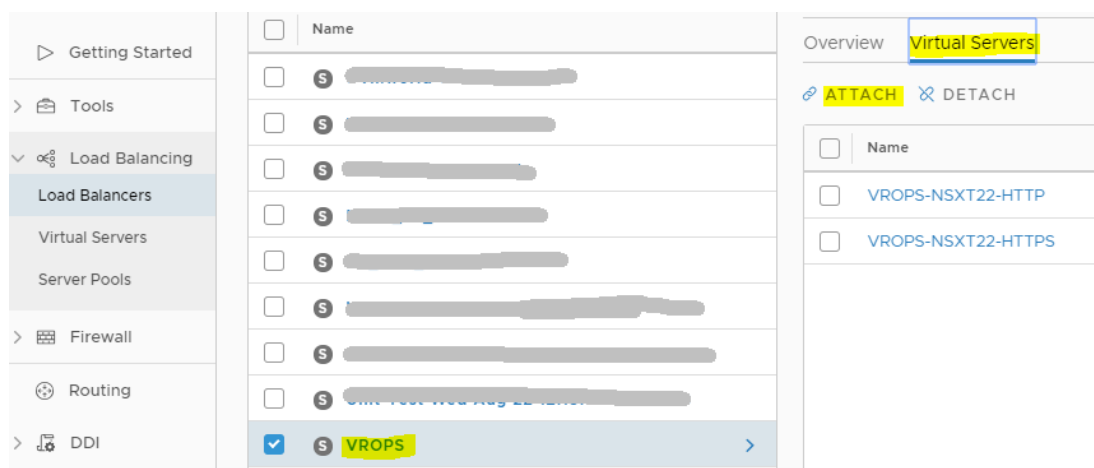

Select the Router to which the Load Balancer VROPS-NSXT22 is to be attached. Only Tier-1 Routers in 'Active Standby' are currently supported.  
Note: The Load Balancer can only be Enabled if it had a Virtual Server associated with it.

OK

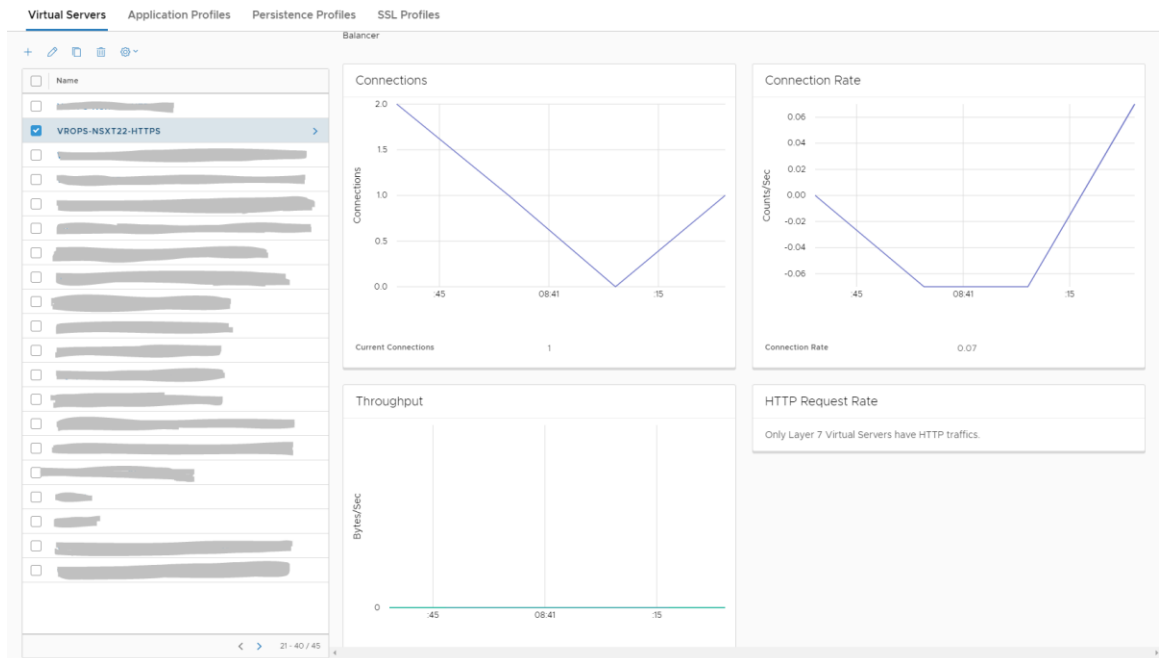

## Verify Components, Pool and Virtual Server Status

After completion of configuration, status of components running on the load balance can be verified. To get an overall view of the nodes, pools and virtual servers need to use steps described below:

- Go to **Load Balancing** → **Server Pools** → **Server Pools**
- Select the pool that you want to verify. For example: vROPS-POOL
- Click on **Pool Member Statistics**. The member IP:Port and status of the selected pool are displayed. The status should be UP. (can be UP or DOWN)

vROPS-POOL						
Overview Virtual Servers Pool Members <b>Pool Member Statistics</b>						
Display Statistics from Load Balancer		VROPS				
IP:Port	Status	Current Sessions	Max Sessions	Bytes in	Bytes out	Http Request Rate
10.10.10.1:443	↑ UP	0	19	0	0	0
10.10.10.2:443	↑ UP	0	18	0	0	0
10.10.10.3:443	↑ UP	0	0	0	0	0
10.10.10.4:443	↑ UP	0	13	0	0	0

- Go to **Load Balancing** → **Virtual Servers** → **Virtual Servers**
- Select the virtual server that you want to verify. For example: VROPS-NSXT22-HTTPS
- Click on **Statistics**. **Connections**, **Connection Rate** and **Throughput** should be displayed. If configuration is mentioned metrics should display status graphs.

## NSX-T Version 2.4, 2.5

### Configure Load Balancer

You need to specify a load-balancer configuration parameter and configure the NSX-T appliance for load balancing by creating the respective service.

- Go to **Networking → Load Balancing → Load Balancers**
- Click the **Add** (**ADD LOAD BALANCER**) icon
- Choose a name, select appropriate sizing (depends on vROPS cluster size), error log level, previously created during installation and configuration “Tier 1 Logical Router” and press OK

The screenshot shows the 'ADD LOAD BALANCER' configuration form in the NSX-T interface. At the top, there are three input fields: 'VROPS' with an asterisk, 'Small' with a dropdown arrow, and 'DONT-DELETE-New-Tier-1-Router' with a dropdown arrow and a close icon. Below these are sections for 'Description' (with a text input field), 'Error Log Level' (with an 'Info' button), 'Tags' (with 'Tag (Required)' and 'Scope (Optional)' input fields, a checkmark icon, and a note 'Maximum 30 tags are allowed.'), and 'Admin State' (with a toggle switch set to 'Enabled'). A note at the bottom states: 'NOTE - Before further configurations can be done, fill out mandatory fields above ( \* ), click 'Save' below.' At the very bottom, there is a 'VIRTUAL SERVERS' section with a 'SAVE' button and a 'CANCEL' button.

- For the following dialog select NO

## Configure Application Profiles

Application profile must be created to define the behavior of a particular type of network traffic.

For NSX-T, two application profiles need to be created to:

3. Redirect HTTP to HTTPS
4. Handle HTTPS traffic

After the configuration of an application profile, the same should be associated with a virtual server. The virtual server then processes traffic according to the options specified in the application profile.

### Configure the Application Profile for HTTP requests:

- Go to **Networking -> Load balancing -> Profiles**
- Select Profile Type **APPLICATION** ▾
- Click the **Add** ( **ADD APPLICATION PROFILE** ▾ ) icon and choose **HTTP Profile**.
- Choose a name for the profile and enter parameters (please refer to the example below)

The screenshot shows the 'Add Application Profile' form in vRealize Operations Manager. The form is titled 'vROPs\_HTTP\_to\_HTTPS' with a red asterisk indicating it is required. The 'Profile Type' is set to 'HTTP' and the 'Port' is '15'. Below the title bar, there are several configuration fields: 'Description' (text input with placeholder 'Enter Description'), 'Request Header Size' (text input with value '1024'), 'X-Forwarded-For' (dropdown menu with value 'Insert'), 'Request Body Size' (text input), 'Redirection' (dropdown menu with value 'HTTP to HTTPS Redirect'), and 'NTLM Authentication' (toggle switch set to 'Disabled'). At the bottom, there are 'Tag' fields with 'Tag (Required)' and 'Scope (Optional)' labels, and a 'SAVE' button next to a 'CANCEL' button. A note at the bottom states 'Maximum 30 tags are allowed.'

### Configure the Application Profile for HTTPS requests:

- Go to **Networking -> Load balancing -> Profiles**
- Select profile type **APPLICATION** ▾
- Click the **Add** ( **ADD APPLICATION PROFILE** ▾ ) icon and choose **Fast TCP Profile**.
- Choose a name for the profile and enter parameters (please refer to the example below)

The screenshot shows the configuration interface for a load balancing profile named 'VROPS\_HTTPS'. The profile is currently 'Disabled'. The 'Fast TCP' checkbox is checked, and the 'Connection Close Timeout' is set to 1800. The 'Description' field is empty, with a placeholder 'Enter Description'. The 'Tags' section shows 'Tag (Required)' and 'Scope (Optional)' fields, with a note 'Maximum 30 tags are allowed.' and a checkmark icon. At the bottom, there are 'SAVE' and 'CANCEL' buttons.

## Configure Persistence Profile

- Go to **Networking -> Load balancing -> Profiles**
- Select profile type **PERSISTENCE**
- Click the **Add ( ADD PERSISTENCE PROFILE )** icon and select **Source IP**
- Choose a name for the profile and enter parameters (please refer to the example below)

The screenshot shows the configuration interface for a persistence profile named 'VROPS\_PERSISTENCE'. The profile is currently 'Disabled'. The 'Description' field is empty, with a placeholder 'Enter Description'. The 'Persistence Entry Timeout' is set to 1800. The 'Purge Entries when Full' checkbox is checked, and 'HA Persistence Mirroring' is disabled. The 'Tags' section shows 'Tag (Required)' and 'Scope (Optional)' fields, with a note 'Maximum 30 tags are allowed.' and a checkmark icon. At the bottom, there are 'SAVE' and 'CANCEL' buttons.

## Add Active Health Monitor

Configuring active health monitoring is similar to creating health checks on other load-balancers. When you associate an active health monitor with a pool, the pool members are monitored according to the active health monitor parameters. To configure an **Active Health Monitor**, perform the following steps:

- Go to **Networking -> Load balancing -> Monitors**
- Select monitor type **ACTIVE**
- Click the **Add ( ADD ACTIVE MONITOR )** icon and select **HTTPS**
- Choose a name for the active monitor and enter **Monitor Properties** (please refer to the example below)

- Configure Health check parameters with the following values:

3. HTTP Method  
GET

4. HTTP Request URL  
/suite-api/api/deployment/node/status?services=api&services=adminui&services=ui (or /epops-webapp/health-check for EPOPS)

5. HTTP Request Version  
1.1

6. HTTP Response Code  
200, 204, 301

7. HTTP Response Body  
ONLINE (upper case)

NAME	INTERVAL	TIMEOUT	RETRIES	TYPE	METHOD	URL	RECEIVE:
vROPS_MONITOR	5	16	3	HTTPS	GET	/suite-api/api/deployment/node/status?services=api&services=adminui&services=ui  ----- Note: For older versions of vROPS from 6.6.1 to 7.5 please use the following URL call, as starting from vROps 8.0 status API enhanced to track separate services status:  /suite-api/api/deployment/node/status \r\n	ONLINE (upper case)
EPOPS_Monitor	5	16	3	HTTPS	GET	/epops-webapp/health-check	ONLINE (upper case)

- Here is an example of how the configuration should look like:

The screenshot shows a configuration form for a monitor in vRealize Operations Manager. The form is titled "vROPs\_MONITOR" and "HTTPS". It includes several input fields and buttons.

Field	Value
URL	443
Port	5
Path	16

Description: Enter Description

Tags: Tag (Required) Scope (Optional) ✓  
Maximum 30 tags are allowed.

Additional Properties:

Property	Action
HTTP Request	Configure
SSL Configuration	Configure
HTTP Response	Configure

Buttons: SAVE, CANCEL

## Configure Server Pools

NSX-T Server Pools are used to contain the nodes that are receiving traffic. You will need to create a single pool per vRealize Operations Manager cluster with all the data nodes participating in the cluster as members. Remote collectors should not be added into this pool.

**Configure a Server Pool:**

- Go to **Networking** → **Load Balancing** → **Server Pools**
- Click the **Add** (**ADD SERVER POOL**) icon
- Choose a **Name** for the pool. For example: vROPs-POOL
- Set **Algorithm** as **LEAST CONNECTION**
- Configure **SNAT Translation Mode** as **Automap**
- Attach an **Active Monitor** to the pool (please refer to the example below)

vROPs-POOL \* Least Conn Select Members

Description Enter Description Active Monitor vROPs\_MONITOR

SNAT Translation Mode Automap

Additional Properties

TCP Multiplexing Disabled Max Multiplexing Connections 6

Passive Monitor Select Passive Monitor Min Active Members 1

Tags Tag (Required) Scope (Optional) ✓  
Maximum 30 tags are allowed.

SAVE CANCEL

## Select Members

- Add the pool members via (vRealize Operations Manager data nodes IP addresses and Port)
  - Name
  - IP Address
  - Weight: 1
  - Port: 443
  - State: ENABLED

POOL NAME	ALGORITHM	MONITORS	MEMBER NAME	IP ADDRESS	WEIGHT	PORT	STATE
vROPS-POOL	LEASTCONN	vROPS_MONITOR	vROPS_NODE1	x.x.x.x	1	443	ENABLED
EPOPS-POOL	LEASTCONN	EPOPS_Monitor	EPOPS_NODE1	x.x.x.x	1	443	ENABLED

## Configure Server Pool Members

Server Pool - vROPS-POOL

☒ Enter individual members

☐ Select a group

Name	IP	Port	Weight	State	Backup Member	Max Concurrent Connections
⋮ DATA3		443	1	Enabled	● Disabled	
⋮ DATA2		443	1	Enabled	● Disabled	
⋮ DATA1		443	1	Enabled	● Disabled	

## Configure Virtual Servers

NSX-T Virtual Servers contain the Virtual IP address (VIP) for the pools of nodes that will be accessed. In this case,

there are two separate VIPs created with the same IP address. One virtual server is used for redirecting insecure HTTP (port 80) traffic to a secure-channel connection – HTTPS (port 443). The second virtual server is used for handling and forwarding secure-channel traffic (HTTPS) to the backend systems.

#### Configure the Virtual Servers for HTTPS requests:

- Go to **Networking → Load Balancing → Virtual Servers**
- Click the Add ( **ADD VIRTUAL SERVER** ) icon and select **L4 TCP**
- Choose a name for the Virtual Server
- Assign appropriate **Application Profile** (please refer to the example below)
- Assign appropriate **Load Balancer** (please refer to the example below)
- Assign appropriate **Server Pool** (please refer to the example below)
- Select **Persistence** as **Source IP** (please refer to the example below)
- Assign appropriate **Source IP** profile (please refer to the example below)
- Assign a VIP (Virtual IP) and port 443 to handle HTTPS requests

Name	IP Address	Ports	Type	Load Balancer	Server Pool
VROPS-NSXT22-HTTPS *	192.168.207.10 *	443 x *	L4 TCP	VROPS	vROPS-POOL
Description		Enter Description		Application Profile *	
Persistence		Source IP		vROPS_HTTPS	
Source IP *		VROPS_PERSISTENCE			
<div>Additional Properties</div> <div> <div>Max Concurrent Connections</div> <div>Unlimited</div> </div> <div> <div>Max New Connection Rate</div> <div>Unlimited</div> </div> <div> <div>Sorry Server Pool</div> <div>Select Server Pool</div> </div> <div> <div>Default Pool Member Ports</div> <div>Enter Ports or Port Ranges</div> <div>(e.g. 8080, 80-90, 443)</div> </div> <div> <div>Admin State</div> <div>Enabled</div> </div> <div> <div>Access Log</div> <div>Disabled</div> </div> <div> <div>Tags</div> <div>Tag (Required) Scope (Optional)</div> <div>Maximum 30 tags are allowed.</div> </div>					

#### Configure the Virtual Servers for HTTP requests:

- Go to **Networking → Load Balancing → Virtual Servers**
- Click the Add ( **ADD VIRTUAL SERVER** ) icon and select **L7 HTTP**
- Assign appropriate **Application Profile** (please refer to the example below)
- Assign VIP (Virtual IP) and port 80 to handle HTTP requests

**Note:** There is no need to configure any Server Pool for this Virtual Server

Name	IP Address	Ports	Type	Load Balancer	Server Pool
VROPS-NSXT22-HTTP *	192.168.207.10 * <small>e.g. 10.10.10.10</small>	80 *	L7 HTTP	VROPS ⊗	Select Server I
Description			Application Profile *
